INTRODUCTION

Traditionally *jyotiḥśāstra* is divided into three *skandhas*: *saṃhitā* (omens), *gaṇita* (astronomy), and *horā* (astrology) (see BS 1, 9); and, according to the medieval *muhūrta* treatises, was originally promulgated by the eighteen sages Brahmācārya, Vasiṣṭha, Atri, Manu, Paulastya, Romaśa, Marīci, Aṅgiras, Vyāsa, Nārada, Śaunaka, Bhṛgu, Cyavana, Yavana, Garga, Kaśyapa, Parāśara, and Sūrya. The validity of the first tradition was maintained only by artificially including new forms of scientific writing—e.g., treatises on mathematics, on *muhūrta*, or on *praśna*—in one or another of the three *skandhas*, while there was never any validity to the second. In this volume an attempt has been made to establish a more accurate classification of the areas of *jyotiḥśāstra* actually made the subject of independent works, and to survey the literature in each area (but omitting the sectarian Jaina contributions) in order to establish a correct historical origin (often from outside of India) and development of each. To have included discussions of the technical aspects of these sciences, however, would both have duplicated much that has already been done (though in some areas it desperately needs to be done better) and have extended the length of this volume far beyond reasonable bounds.

Nor has any attempt been made to deal with the literary qualities of the works discussed. The primary texts are certainly all in metrical form, but are generally written in a very crabbed and obscure style designed to stimulate the student's memory of the procedures to be followed, but frequently not even pretending to provide the full algorithm for solving a particular problem; that was to be found, if not in the repetitiousness of the science, in the guru's oral tradition or in the prose commentary. Thus, while cleverness and imprecision both abound in this poetry, the normal canons of *alaṅkāra* are simply not applicable; only rarely, as in the *ṛtuvarṇana* in Bhāskara's SŚB, is any poetic feeling made manifest.

Two of the difficulties generated by the use of a poetic form were the necessity of expressing numbers metrically, and the difficulty of maintaining a fixed technical vocabulary. The latter impediment led to the invention of many synonyms, and the use of single terms in several different, if related, senses; this, of course, increased the ambiguity and imprecision inherent in a system where the texts' purpose is to jog the memory rather than to teach the complete course. The former problem was solved in two ways: by using common objects that appear or are understood to appear in the world in fixed quantities as synonyms for those quantities (e.g., "eyes" are "two," "fires" are "three," "Vedas" are "four"), and by using *akṣaras* to refer to numbers. The former system, called the *bhūtasāṅkhyā*, already appears in the third century in Sphujidhvaja's Yavanajātaka. Sphujidhvaja also seems to be the

first to use a symbol for zero (*bindu*) in the decimal place-value system (YJ 79, 6 and 7), though, of course, a dot or a circle had been used previously by both Babylonians and Greeks in the sexagesimal place-value system to represent a place with no other number in it. Āryabhaṭa invented a different way of expressing numerals, in which the consonants of the Sanskrit alphabet are used to indicate the numbers and the vowels their places (up to eighteen); unfortunately, the “words” formed thus were often unpronounceable and in any case had no meaning other than the numerical one. A different system was invented in South India that obviated this difficulty. The *kaṭapayādi* system (in which k, ṭ, p, and y equal 1 regardless of the vowel they are followed by) uses the consonants as equivalents of the numbers 1 to 9 and 0; four varieties of this system are known. A clever *jyotiṣī*, then, can construct verses that are superficially on one subject while each sequence of consonants can be read as a significant number; a good example of this is Parameśvara’s Hari-carita.

The following pages will show that our knowledge of Indian *jyotiḥśāstra* is rather spotty. This is due both to the accidents that cause the preservation (and availability) of one text rather than another, and to the lack of reliable and accurate descriptions of the many unpublished manuscripts. The second disability is being slowly alleviated as CESS progresses; I have generally referred the reader to it, when available, for information about an author, his works, and what modern scholars may have said about them, though I have attempted in all cases to give reasonably complete listings of published editions as they are a useful guide to modern interests. Those modern interests lie overwhelmingly in *jātaka*, *tājika*, *muhūrta*, *praśna*, and various forms of divination; classical astronomy and mathematics had virtually ceased to be studied or taught by the end of the nineteenth century. A new group of Indian and foreign scholars has, however, begun to work in these areas since World War II; and, while much is still unfortunately published that is of little or no value, some progress toward an understanding of the origins and developments of these sciences has been made. I hope that this volume will stimulate more serious interest in this field.

CHAPTER I

ŚULBASŪTRAS

In the performance of Vedic *śrauta* rituals an essential prerequisite is the piling up of the fire altar (*agnicayana*). These altars (*citis*) take the form of various objects; the forms mentioned in Taittirīyasaṃhitā 5, 4, 11 (after the *chandaściti*¹ or “meter altar”) and the sacrificers who should erect them are:

1. *śyenaciti* or “hawk altar”² by one desiring heaven (*suvarga*);
2. *kaṅkaciti* or “heron altar” by one desiring a head in the other world;
3. *alajaciti* or “*alaja*-bird altar” with four furrows by one desiring support;
4. *praūḡaciti* or “triangle altar” by one desiring to repel his foes;
5. *ubhayataḥ praūḡaciti* or “triangle on both sides altar” by one desiring to repel both present and future foes;
6. *rathacakraciti* or “chariot-wheel altar” by one wishing to defeat his foes;
7. *droṇaciti* or “trough altar” by one desiring food;
8. *samūhyaciti*³ or “things to be gathered together altar” by one desiring cattle;
9. *paricāyyciti*⁴ or “circle altar” by one desiring a village;
10. *śmaśānaciti*⁴ or “cemetery altar” by one desiring the world of the fathers (*pitṛloka*).

A few other altar-shapes are described in other Brāhmaṇas, where also are prescribed the rituals to be performed at these altars. The Śrautasūtras belonging to the Yajurveda often include as appendices treatises that give rules concerning the geometry involved in the construction of these altars. These treatises are known as the Śulbasūtras.⁵

¹ An imaginary altar constructed in the sacrificer’s mind, but with the recitation of the appropriate mantras.

² Called *suparṇaciti* in ŚB. 6, 7, 2, 8. This is the principle altar shape of which the others were regarded as derivatives.

³ Called the *samūhyapuriṣaciti* in ŚB.

⁴ Omitted by ŚB.

⁵ See B. DATTA, *The Science of the Śulba*, Calcutta 1932; A. MICHAELS, *Beweisverfahren in der vedischen Sakralgeometrie*, Wiesbaden 1978; and T. A. SARASVATĪ AMMA, *Geometry in Ancient and Medieval India*, Delhi—Varanasi—Patna 1979, pp. 14—60. Still informative is G. THIBAUT, “On the Śulvasūtras,” JASB, NS 44 (1875), 227—275.

The Śrautasūtras containing Śulbasūtras are those of Baudhāyana,⁶ in which the Śulbasūtra is *praśna* 30;⁷ of Āpastamba,⁸ in which the Śulbasūtra is also *praśna* 30;⁹ of Vādhūla,¹⁰ whose Śulbasūtra is said to survive in a manuscript at Madras;¹¹ of Mānava,¹² in which the Śulbasūtra is *adhyāya* 10¹³ (a recension of this is entitled the *Maitrāyaṇīyasulbasūtra*¹⁴); of Varāha,¹⁵ whose Śulbasūtra survives in a manuscript at Mysore;¹⁶ and of Kātyāyana,¹⁷ in which the Śulbasūtra is *pariśiṣṭa* 7.¹⁸ The last of these belongs to the Śuklayajurveda (the Vājasaneyisaṃhitā), the first five to the Kṛṣṇayajurveda (Baudhāyana, Āpastamba, and Vādhūla to the Taittirīyasamhitā, and Mānava and Varāha to the Maitrāyaṇīyasamhitā).

Precise dating of any of these texts is impossible. The earliest, that of Baudhāyana, was perhaps written before 500 B.C., and the remainder presumably antedate the Christian era. It was, indeed, during this period also, probably in the second century B.C., that the most striking *śyenaciti* of which remains survive was built in Kauśāmbī.¹⁹ The Āpastamba appears to be the second oldest of the major Śulbasūtras, and the Kātyāyana, which consists of

a *sūtra* section (to a large extent repeating *sūtras* of the Āpastamba verbatim), followed by a verse section, is among the latest; the Mānava has apparently copied some verses from the Kātyāyana.

Each of the basic altars must be constructed with five layers of bricks, and there must be a fixed number of bricks in each layer; moreover, the bricks in the second and fourth layers must not be directly above or below those in the first, third, and fifth layers. And the surface covered by the altar, regardless of its shape, must cover an area of seven and one half square *puruṣas* or, for certain purposes, that area increased by specified numbers of square *puruṣas*, or it must be multiplied by a given factor. Finally, the altar must be correctly oriented with respect to the cardinal directions. The task faced by the authors of the Śulbasūtras was to prescribe rules for laying out these altars with only a rope (*rajju* or *śulba*) of determined length and posts or gnomons (*śaṅku*).²⁰ The geometrical problems that were solved by these altar-builders are indeed impressive, but it would be a mistake to see in their works the unique origin of geometry;²¹ others in India and elsewhere, whether in response to practical or theoretical problems, may well have advanced as far without their solutions having been committed to memory or eventually transcribed in manuscripts.

The solutions utilized by the *sūtrakāras* involve the knowledge of a number of specific right-angled triangles (e.g., 3, 4, 5; 5, 12, 13; 7, 24, 25; 8, 15, 17; 12, 35, 37; and 15, 36, 39) as well as the general rule that the square on the diagonal of a rectangle (square or oblong) is equal to the sum of the squares on two sides; of the approximation

$$\sqrt{2} \approx 1 + \frac{1}{3} + \frac{1}{3 \times 4} - \frac{1}{3 \times 4 \times 34};$$

and the radius, *r*, of a circle whose area is approximately equal to a square of side *x*:

$$r = \frac{x}{2} + \frac{\frac{x}{2} \cdot \sqrt{2} - \frac{x}{2}}{3}.$$

They also give particular solutions to certain indeterminate equations, though without any hint at the method by which they arrived at them.²²

The Baudhāyanaśulbasūtra in the edition by Prakash and Sharman contains ten *adhyāyas* divided into 21 *khaṇḍas* (4, 3, 2, and 6 *khaṇḍas* in the first four

²⁰ A. K. BAG, "The knowledge of Geometrical Figures, Instruments, and Units in the Śulbasūtras," EW 21 (1971), 111–119.

²¹ A. SEIDENBERG, "The Origin of Mathematics," AHES 18 (1978), 301–342.

²² For specific aspects of the geometry of the Śulbasūtras one should consult, in addition to the books and articles previously cited, those listed in the article on Āpastamba in CESS A1, 50a, as well as R. C. GUPTA, "Baudhāyana's Value of $\sqrt{2}$," ME 6 (1972), B 77–79, and R. P. KULKARNI, "The Value of π Known to Śulbasūtrakāras," IJHS 13 (1978), 32–41.

adhyāyas respectively, 1 *khaṇḍa* in each of the remaining six *adhyāyas*); these correspond to three *adhyāyas* in Thibaut's edition:

Thibaut	Prakash and Sharman
<i>adhyāya</i> 1	<i>adhyāya</i> 1 = <i>khaṇḍas</i> 1–4.
<i>adhyāya</i> 2	<i>adhyāya</i> 2 = <i>khaṇḍas</i> 5–7.
<i>adhyāya</i> 3	<i>adhyāyas</i> 3–10 = <i>khaṇḍas</i> 8–21.

The total number of *sūtras* is 519. The work begins with definitions of the measures used in the constructions and the geometrical propositions employed in designing them; there follows a description of the spatial relations in different altars; and finally there come the rules for constructing the *gūrhapatyaciti* and *chandaściti* (*khaṇḍa* 7), the *śyenacit* (*khaṇḍas* 8–9), the *vakrapakṣa vyastapuccha* (*khaṇḍas* 10–11), the *kaṅkacit* (*khaṇḍa* 12), the *ajalacit* (*khaṇḍa* 13), the *prāṅgacit* (*khaṇḍa* 14), the *ubhayataḥ prāṅga* (*khaṇḍa* 15), the *rathackracit* (*khaṇḍa* 16), the *droṇacit* (*khaṇḍas* 17–18), the *śmaśānacit* (*khaṇḍa* 19), and the *kūrmacit* (*khaṇḍas* 20–21). The Baudhāyana was commented on by Dvārakānātha Yajvan,²³ whose Śulbadīpikā was composed after Āryabhaṭa, and by Veṅkateśvara Dikṣita, who wrote his Śulbamīmāṃsā in the Vijayanagara kingdom in about 1600.

The Āpastamba, which is divided into six *paṭalas* and twenty-one *adhyāyas* (3 *adhyāyas* in *paṭalas* 1, 3, and 5, 4 in *paṭalas* 2, 4, and 6), presents essentially the same material as does the Baudhāyana, though with fewer variations on the basic forms of the altars, in 223 *sūtras*. It was commented on by Kapardisvāmin,²⁴ who apparently lived before 1150 (Kapardibhāṣya); by Karavindasvāmin,²⁵ who has followed Kapardisvāmin (Śulbapradīpikā) and quotes from the Āryabhaṭīya; by Gopāla²⁶ (Rahasyaprakāśa); and by Sundararāja, the famous Kerala astronomer of the end of the fifteenth century (Sundararājīya).

The first section of the Kātyāyana, which consists of ninety *sūtras*, is divided into six *kaṇḍikās*. It teaches, in language often identical with or similar to the Āpastamba's, the geometrical propositions (including the first detailed instructions for determining the cardinal directions from the shadows cast by a gnomon), the measures employed in constructing the altars, and their spatial relationships. The second section, which consists of more than 40 verses, repeats some of the material given in the *sūtra* section, and adds to it descriptions of the rope, the gnomon, and the expert builder of altars. There are commentaries on the Kātyāyana by Karka,²⁷ who wrote before 1260/1270 (Karkabhāṣya); by Rāma Vājapeyin, who composed three of them²⁸ (the Śulbavārttika, a metrical gloss

on the Kātyāyana and on the Karkabhāṣya, in 1434; the Śulbavārttikaṭikā, a commentary on the preceding; and the Śulbasūtravṛtti, a prose commentary based on the Śulbavārttika) at Naimiṣa in Uttarapradeśa; and by Mahīdhara²⁹ at Vārāṇasī in 1590 (Śulbasūtravivarāṇa).

Finally, the Mānava, which is divided into seven *khaṇḍas*, describes the rope and the gnomon, the measures, the spatial relations of altars, the sacrificial fees, and the method of constructing the *suparnaciti*. The closely related Maitrāyaṇīya, which is divided into four *khaṇḍas*, arranges this material in a different fashion. The Mānava was commented on by Śivadāsa at Vārāṇasī, the Maitrāyaṇīya by his younger brother, Śaṅkarabhaṭṭa; the two brothers both quote from Rāma Vājapecyin, and therefore lived after 1450.

²⁹ CESS A 4.

CHAPTER II

ASTRONOMY¹

Many Vedic sacrifices are to be performed at specific times determined by the position of the Sun relative to its northern (*uttarāyana*) or southern (*dakṣiṇāyana*) path, the synodic month and the night within it, or the position of the Moon with respect to the *nakṣatras*. The first attempt in India to describe the motions of the Sun and the Moon relative to the *ayanas*, the *nakṣatras*, and each other was the *Jyotiṣavedāṅga* composed by Lagadha. He clearly states his purpose (JV Rk 36; repeated at the end of *Paitāmahasiddhānta* 9, 8):

For the Vedas have come forth for the sake of sacrifice, and sacrifices are established in the orderly succession of times. Therefore, he who knows this *jyautiṣa*, the science of determining times, knows the sacrifices.

This purpose shifted somewhat later on when it was no longer as important to decide when Vedic sacrifices should take place as it was to fix the proper moments (*muhūrta*) for performing the *saṃskāras* and to compute the calendar (*pañcāṅga*) which indicated festivals, auspicious and inauspicious times (*tithis*, *yogas*, or *karaṇas*), entries of the Sun into zodiacal signs (*saṅkrāntis*), eclipses (*grahaṇas*), and the like. Another motive for the development of astronomy in India, at least after the second century A.D., was the need to compute with reasonable accuracy the positions of the planets for the purpose of casting horoscopes. And a final goal of the astronomers, though only to a slight degree realized, was the application of this science to geographical problems. Such practical aims, of course, must often have been secondary to individuals whose primary motivation was intellectual curiosity.

The history of Indian astronomy can be divided into five main periods, depending in most cases on the foreign origin:

1. Vedic (ca. 1000 B.C.—400 B.C.), in which some of the basic Indian calendaric terms were introduced,² but in which only a crude and rudimentary mathematical structure is evident. As there is no astronomical literature as such from this period it shall not be considered further in this book.

2. Babylonian (ca. 400 B.C.—200 A.D.).

¹ A detailed survey of this field is given in D. PINGREE, "History of Mathematical Astronomy in India," DSB, vol. 15, New York 1978, pp. 533—633 (henceforth cited as "History").

² "History," pp. 534—536.

3. Greco-Babylonian (ca. 200–400).
4. Greek (ca. 400–1600).
5. Islamic (ca. 1600–1800).

Though the fundamental approach and many of the models and parameters of each period were determined by the foreign sources, the basic traditions of Indian astronomy imposed on these external systems its peculiar stamp, and transformed the science of Mesopotamia, Greece, or Iran into something unique to India.

Babylonian³

The literature on astronomy in Sanskrit is headed by the *Jyotiṣavedāṅga*, which has come down to us in two recensions: that of the *Ṛgveda* in 36 verses, ascribed to Lagadha (or to Śuci following Lagadha), and that of the *Yajurveda* in 43 or 45 verses, of which 29 occur also in the *Ṛgveda* recension.⁴ The earlier of these two recensions is clearly the shorter, that of the *Ṛgveda*, as it alone preserved the original period relation of Lagadha's intercalation cycle:

$$5 \text{ solar years} = 1830 \text{ sidereal days} = 62 \text{ synodic months} = 1860 \text{ tithis} \\
(\text{JV, } \text{Ṛk } 32 = \text{Yajus } 5; \text{Ṛk } 4 = \text{Yajus } 13; \text{Ṛk } 18 = \text{Yajus } 39; \\
\text{Ṛk } 8 = \text{Yajus } 9; \text{ and } \text{Ṛk } 12 = \text{Yajus } 27).^5$$

The *Yajus* has introduced two verses (28–29) that misinterpret this relation by taking the 366 sidereal days (= 365 civil days) in each year to be themselves civil days.

³ "History," pp. 536–538.

⁴ The *Yajus* recension with variants from the *Ṛk* and the generally unrewarding commentary by Somākara Śeṣanāga was edited by A. WEBER, *Über den Vedakalender Namens Jyotisham*, Berlin 1862; the text of the *Yajus* recension along with the non-*Yajus* verses of the *Ṛk* recension were edited by G. THIBAUT, "Contributions to the Explanation of the *Jyotisha-Vedāṅga*," *JAS Bengal* 46 (1877), 411–437; the *Ṛk* recension with a Marāṭhī translation was published by J. B. MOḌAKA of Thana in 1885; both recensions were edited and commented on by BĀRHASPATYA (LĀLA CHOṬELĀL) in the *Hindustan Review* for 1907 (reprinted Allahabad, 1960) and again, with Somākara's *Bhāṣya* on the *Yajus*, by S. DVIVEDIN (Benares, 1908). The *Yajus* recension was published with his own Sanskrit commentary and an English version by R. SHAMASASTRY (Mysore, 1936).

⁵ The fundamental interpretation of the *JV* is D. PINGREE, "The Mesopotamian Origin of Early Indian Mathematical Astronomy," *JHA* 4, 1973, 1–12. It has recently been most unconvincingly argued that the two Mesopotamian instruments for measuring time used in this period—the outflowing water-clock (*ghaṭikā*) and the gnomon (*śaṅku*)—were indigenous to India; see S. S. LISHK and S. D. SHARMA, "Season Determination through the Science of Sciatherics in Jaina School of Astronomy," *IJHS* 12 (1977), 33–44, and "Length of the Day in Jaina Astronomy," *Centaurus* 22 (1978), 165–176.

The age of Lagadha's work can be fixed from the following considerations. Its language is post-Vedic, and it imitates Piṅgala's Chandaḥsūtra in using the final or first syllables of the names of the *nakṣatras* as their designations;⁶ its period relation is copied in the oldest Paitāmahasiddhānta, whose epoch is 11 January 80;⁷ and its astronomy reflects that of Mesopotamia in the Achaemenid period. It is likely, therefore, that it was composed not very many years before or after 400 B.C., when the Achaemenids controlled Gandhāra.

Lagadha has retained the Vedic list of twenty-seven *nakṣatras* beginning with Kṛttikā, but treats them not as constellations, but as measurements of arcs on the ecliptic of 13;20° each beginning with the vernal equinox. This adaptation means, of course, that the actual position of the equinoctial and solstitial colures with respect to the fixed stars can not be used for dating the JV. He introduced into Indian astronomy the Mesopotamian concepts of the possibility of describing mathematically the periodicity of celestial motions; their use of linear zig-zag functions to describe periodic deviations from the mean (Rk 7 = Yajus 8 and Rk 22 = Yajus 40); and their artificial time-unit, a thirtieth of a mean synodic month (named *tithi* in Sanskrit). He gives rules for computing the mean longitudes of the Sun and the Moon in terms of *nakṣatras*, but mentions neither the planets nor the zodiacal signs. Other texts that reflect this level of astronomy are Kauṭilya's Arthaśāstra (2, 20) and the Buddhist Śārdūlakarṇāvadāna (Divyāvadāna 33). The revised system of the Yajus recension is used in the Jaina Sūriyapannatti and Caṃḍapannatti and in the verses ascribed to Garga in Somākara's Bhāṣya.

Greco-Babylonian⁸

Planetary astronomy was introduced into India from Greece in conjunction with astrology as it was essential to possess some means of determining planetary positions in order to be able to cast horoscopes. The form of planetary astronomy originally transmitted represented Greek adaptations of the Babylonian astronomy of the Seleucid period; this was supplemented by other elements of early Greek astronomy, especially elements associated with Hipparchus.⁹ Some of the calendaric and other timekeeping conventions of the JV were also adopted by the practitioners of this type of astronomy in India.

Two Sanskrit texts have preserved for us what remains of Greco-Babylonian astronomy in India. Sphuḥidhvaja (269/70) describes some aspects of it in the last chapter (79) of the Yavanajātaka,¹⁰ a text based in large part on the

translation of a Greek text from Alexandria made by Yavaneśvara in 149/150; Sphujidhvaja (YJ 79, 3) refers to a *siddhānta* by Vasiṣṭha. Varāhamihira in the sixth century summarized in his *Pañcasiddhāntikā*¹¹ a Vasiṣṭhasiddhānta whose epoch is 3 December 499 (PS 2; and, probably, 17, 1–60), a Romakasiddhānta (*siddhānta* of the Romans) of the third or fourth century (PS 1, 9–10 and 15; and 8), and a Pauliśasiddhānta (*siddhānta* of Paulus?) of the same period (PS 1, 11–13; 3; and 17, 64–80). The last two *siddhāntas* were known to Varāhamihira in recensions produced by Lāṭadeva; his epoch for them was 21 March 505. The original version of the Romakasiddhānta was probably the one used by Bhāskara (629) in his *Bhāṣya* on A (pp. 183, 186 and 202).

The Babylonian component of the astronomy expounded in these works is especially noticeable in the planetary theory which is based on the well known period relations for the planets, and the divisions of the synodic periods at the Greek-letter phenomena (YJ 79, 35–36, and PS 17), and in the elaborate lunar theory of the Vasiṣṭhasiddhānta (PS 2, 2–6) and the Pauliśasiddhānta (PS 3, 4–9). It would not have been possible to compute planetary positions with only the information in the texts as extant; their original forms were presumably more complete. The Hipparchan elements include the year-length 6,5;14,48 civil days (probably YJ 79, 34), which is combined with the Metonic cycle in the Romakasiddhānta (PS 1, 9–10 and 15); values close to his maximum solar and one of his maximum lunar equations, also in the Romakasiddhānta (PS 8); and the use of analemmata to solve problems in spherical trigonometry in the Pauliśasiddhānta (PS 3). Also from Hipparchus came the concept of the precession and trepidation of the equinoxes,¹² and, most likely, the polar coordinate system for fixing the positions of the fixed stars and the value 3438 for the Radius in tables of Sines.¹³ This value of R first appears in India in the early fifth century (Pait. 3, 12); Varāhamihira uses $R = 120$ (PS 4, 6–15).

The other main topics dealt with in these texts, in so far as we know them, were the computations of lunar (PS 6: Pauliśasiddhānta) and solar (PS 7: Pauliśasiddhānta; and 8: Romakasiddhānta) eclipses. Both seem to reflect Hellenistic astronomy as it was influenced by Mesopotamia, though no extant Greek texts can be pointed to as sources. It is likely that the formulas for solving problems in spherical trigonometry and the analemmata that lie behind them in PS 4 also were originally transmitted to India from the Roman Empire.

*Greek*¹⁴

By the early fifth century when the Brāhmapakṣa began there had been introduced into India a more sophisticated form of Greek astronomy characterized by planetary models comprising the combination of an eccentric deferent with an epicycle (but without Ptolemy's equant or special model for Mercury), or a Peripatetic model with two independent epicycles whose centers are carried by a concentric deferent,¹⁵ or one in which each inequality is accounted for by a concentric circle with an equant.¹⁶ The inequalities in the motions of the Sun and the Moon are computed by means of an eccentric, a concentric deferent with an epicycle (the preferred model), or a concentric circle with an equant; in the earlier part of the Greek period Ptolemy's second lunar inequality was not known, though it was introduced into India from Islamic sources in the tenth century.

As these geometric models of planetary motion based on the idea of the circularity of their orbits were introduced into India, it became necessary to modify the traditional Indian cosmology as expressed in the Purāṇas and other texts. This was done by transforming the disc of Jambūdvīpa into a sphere and Meru into the terrestrial North Pole; along the equator at 90° distance from each other lie Lāṅkā on the prime meridian, Romakaviśaya, Siddhapura, and Yamakoṭi; opposite Meru at the South Pole is Vāḍavāmukha. The axis of the universe passes through Meru and Vāḍavāmukha and the poles of the spheres of the planets and of the *nakṣatras*; the spheres of the planets rotate from West to East at a uniform velocity, driven by bonds of wind, while they and the sphere of the *nakṣatras* rotate diurnally from East to West. The deviations of the planets from their mean motions are caused by demons stationed at their *manda* (accounting for the equation of the center) and *śighra* (accounting for the equation of the anomaly) *uccas* pulling them towards themselves by cords of wind. The relative distance of each planet's sphere from the center of the system—that is, the center of the earth—can be computed by comparing their sidereal periods since they move equal spatial distances (but unequal angular distances) in equal times. Absolute values for planetary distances depend on the assumption of an arbitrary number of *yojanas* in the orbit of one of them (that of the Moon was normally chosen). In order to retain the Greek order of the planets in which the Sun is further distant from the earth than Venus, the Indians operated with the motion of Venus' (and then, by analogy, Mercury's) *śighra*; in Ptolemaic terms the *śighra* for an inferior planet is the sum of its (i.e., the Sun's) mean motion and its anomalistic motion.

In order to compute the mean longitudes of the planets the Indians adapted the Greek idea of a "great year" which begins and ends with a mean planetary

¹⁴ "History," pp. 555–625.

conjunction to the already existing theory of the Kalpa.¹⁷ The choice of the subdivisions of the Kalpa (see Table 1) and of the number of rotations of each of the planets within it (see Table 2) are two of the main features that distinguish one *pakṣa* or school of astronomy from another, the others being the geometrical models for planetary motion and their parameters (see Table 3). It was demonstrated by R. Billard that the mean longitudes computed by the two systems of Āryabhaṭa converge in accuracy on about 500, and this led him to suggest that Āryabhaṭa founded Indian astronomy in the form which we have called "Greek" on the basis of his own extraordinarily precise observations.¹⁸ However, the same phenomenon is explained in a way that fits better into the known facts of the history of Indian astronomy: that "Greek" astronomy existed in India before Āryabhaṭa; that the geometrical models solve problems faced by Greeks rather than by Indians, and must have been accompanied by means of computing mean longitudes when they were transmitted to India; and that all of the Indian evidence is against the theory of their being able to make accurate observations. This alternate explanation assumes that two procedures were used.¹⁹ One, utilized by the Brāhmapakṣa, consists of an expansion of Babylonian-type period relations to numbers of rotations of the planets in a Kalpa by assuming a fixed time between the beginning of the Kalpa and the beginning of the current Kaliyuga on 18 February — 3101, and a close proximity to a mean conjunction of the planets on the latter date. This problem results in a series of indeterminate equations that can be solved by the *kuṭṭaka*. Āryabhaṭa could have arrived at his surprising accuracy by using a reasonably accurate set of Greek astronomical tables to compute the mean longitudes of the planets on 21 March 499, and by assuming a true mean conjunction of the planets 3600 years earlier, on 18 February — 3101.

The five main *pakṣas* that developed in India are the Brāhma,²⁰ the Ārya,²¹ the Ārdharātrika,²² the Saura,²³ and the Gaṇeśa;²⁴ the Brāhma and the Saura both were revised in the medieval period. There are, as well, some texts which belong to no *pakṣa*,²⁵ and some derived from Islam.²⁶ These find their expression in various literary forms, which were classified under three main headings from the seventh century on. *Siddhāntas* are comprehensive treatises deducing mean motions from the beginning of the Kalpa or the current Kaliyuga; *karaṇas* are

more concise expositions of astronomy in which the mean longitudes for a time close to the date of composition are given, and the mean longitudes at later times are computed therefrom; and *koṣṭhakas* are sets of astronomical tables, for determining planetary positions or for solving other problems in astronomy. There are as well many specialized works on aspects of astronomy, of which the most important group is on observational instruments (*yantra*).

Table 1

Brāhma:

Kalpa	= 4,320,000,000 years
Kalpa	= 14 Manvantaras (Manvantara = 71 Mahāyugas = 306,720,000 years) + 15 Sandhis (Sandhi = Kṛtayuga = 1,728,000 years)
Kalpa	= 1000 Mahāyugas or Caturyugas (Mahāyuga = 4,320,000 years)
Mahāyuga	= Kṛtayuga (1,728,000 = 432,000 · 4 years) + Tretāyuga (1,296,000 = 432,000 · 3 years) + Dvāparayuga (864,000 = 432,000 · 2 years) + Kaliyuga (432,000 years)
Beginning of Kalpa to beginning of current Kaliyuga:	
	1,972,944,000 = 432,000 · 4567 years

Ārya = Ārdharātri:

Kalpa	= 4,354,560,000 years
Kalpa	= 14 Manvantaras (Manvantara = 72 Mahāyugas = 311,040,000 years)
Kalpa	= 1008 Mahāyugas (Mahāyuga = 4,320,000 years)
Mahāyuga	= Kṛtayuga (1,080,000 years) + Tretāyuga (1,080,000 years) + Dvāparayuga (1,080,000 years) + Kaliyuga (1,080,000 years)

Saura: same as Brāhma, but with an initial period of non-motion at the beginning of the Kalpa amounting to 17,064,000 years.

Table 2^[1]

Rotations of the planets in a Mahāyuga

	Brāhma	Ārya	Ārdharā- trika	Saura	Adjusted Saura
Saturn	146,567.298	146,564	146,564	146,568	146,580
Jupiter	364,226.455	364,224	364,220	364,220	364,212

Siddhāntas

The earliest *siddhānta* that has come down to us is a Paitāmahasiddhānta²⁷ of the early fifth century. This is preserved because of its incorporation into the Viṣṇudharmottarapurāṇa²⁸ (2, 166–174), though it also (or at least the astronomical section, chapters 168–174) has been copied as an independent treatise.²⁹ Its position as the source of the Brāhmapakṣa is made evident by Brahmagupta's dependence on it in composing the first ten chapters (Daśādhyāyī) of the BSS, and was explicitly recognized by Kamalākara (Siddhāntatattvaviveka 1, 62). Its chronological position is fixed by the fact that Sassanian astronomers in about 450 knew one of its characteristic parameters;³⁰ this makes it more than likely that Pītāmaha is the Svayambhū referred to by Āryabhaṭa (A Gola 50), whose Kalpa-system is a modification of the Brāhmapakṣa's (he even accepts the Brāhma's rotation of the *uccas* and *pātas* [A Daśāgītikā 7 and Gola 2] despite the fact that in his system that is unnecessary), whose table of Sines (A Daśāgītikā 10 and Gaṇitapāda 12) is derived from the Pait. (3, 12), and who copies various other formulae from the same source.

The Pait. is cast in the form of a lecture by Brahmā to Bhṛgu. Its first two chapters deal with astrology. Chapter three discusses time-measurements, the parameters of the planetary system, Sines and Versines, the declination of the Sun and latitudes of the planets, gnomon-problems, right and oblique ascensions, a star catalogue, the Greek-letter phenomena of the planets, and the calendar; this confused congeries is also indicative of the age of the Pait. as later *siddhāntas* are arranged far more systematically. Chapter four covers the computation of the *ahargana* (number of days lapsed since epoch), the astrological lords of the years, days, and *parvans*, the computation of the mean and true longitudes of the planets and of their latitudes, and the times of the occurrences of the planets' first and second stations. Chapter five deals with the earth's shadow (for lunar eclipses), *saṅkrāntis*, *tithis*, *karaṇas*, *yogas*, and the *vaidhṛta* and *vyatipāta pātas*. Chapter six covers some problems in spherical trigonometry and their solution by means of analemmata. Chapter seven is devoted to the computation of the ascendant and of the time lapsed since sunrise. Chapter eight presents the method of computing the times and longitudes of the first and last visibilities of the planets and fixed stars. And chapter nine gives rules for computing the illumination of the Moon and longitudinal and latitudinal parallax (for solar eclipses). Several of these rules are incomplete or wrong as presented in the two editions, and only the preliminaries for computing lunar

and solar eclipses are given. One suspects that the original Pait. was a more competent work than what we now possess of it.

Āryabhaṭa³¹ was 23 years old in 3600 Kali = A. D. 499 (A Kālakriyā 10) and wrote his Āryabhaṭīya³² at Kusumapura (A Gaṇitapāda 1), which is identified by Bhāskara in his commentary on this verse with Pāṭaliputra (p. 45). The same Bhāskara, in a series of examples relating to the *kuttaka*, refers to the Āsmakasya *gaṇita* (p. 138), or Āsmakīya (pp. 140, 146, 147, and 148), or Āsmaka as an authority on the subject, and he applies to the Āryabhaṭīya the epithet Āsmaka (e.g., in MB 1, 3). Scholars, beginning at least with Nīlakaṇṭha (on A Gaṇitapāda 1), have contended on this basis that Āryabhaṭa was born in the Āsmaka country between the Godāvarī and the Narmadā; but the epithet may only reflect Bhāskara's own origin and training in Āsmaka.

The Āryabhaṭīya, which is the basic text of the Āryapakṣa, is not, strictly speaking, a *siddhānta* since it combines, in extreme conciseness, the fundamentals of both astronomy and mathematics. It is divided into four *pādas*. The Daśagītikā gives the planetary parameters, the divisions of the Kalpa, and a table of the first order differences of the Sines; at one point Āryabhaṭa refers to the diurnal rotation as a rotation of the earth (A Daśagītikā 3; see also Golapāda 9–10) but elsewhere (A Golapāda 16) he mentions the mathematically equivalent theory of the rotation of the fixed stars (*bhagola*). The theory of the diurnal rotation of the earth was fiercely attacked by many later Indian astronomers, beginning with Varāhamihira (PS 13, 6–7). The Gaṇitapāda, on mathematics, will be briefly discussed in chapter III. The Kālakriyāpāda defines time units, describes two geometrical models of planetary motion (eccentric with epicycle and concentric with two epicycles), and gives rules for computing the true longitudes of the planets. Finally, the Golapāda expounds Āryabhaṭa's cosmology and geography, explains the apparent motions of the heavenly bodies, and gives solutions for problems in spherical trigonometry and rules for computing eclipses. The Āryapakṣa which evolved from the A was for most of its history popular mainly in South India, though the earliest extant commentaries were composed in Gujarāt—the Āryabhaṭīyabhāṣya of Bhāskara³³ at

KERN, Leiden 1875, reprinted (with a Hindi translation by UDAYA NARAYANA SINGH), Madhurapur, Etawah, 1906, and Osnabrück 1973; with the Bhāṣya of Nīlakaṇṭha (omitting the Daśagītikā) by K. SAMBASIVA SASTRI (2 vols., TSS 101 and 110) and S. K. PILLAI (TSS 185), Trivandrum 1930–1957; with Sanskrit and Hindi commentaries by B. MISHRA, Patna [1966]; with an English translation by K. S. SHUKLA and K. V. SARMA, New Delhi 1976; with the commentaries of Bhāskara (to Golapāda 6) and Someśvara (Golapāda 6–50) by K. S. SHUKLA, New Delhi 1976; and with the commentary of Sūryadeva Yajvan by K. V. SARMA, New Delhi 1976. The Gaṇitapāda was published with a German translation and commentary by K. ELFERING, Die Mathematik des Āryabhaṭa I, München 1975. There are English translations of the whole work by P. C. SENGUPTA, JDL/UC 16 (1927), art. 6, and by W. E. CLARK, Chicago 1930.

³³ CESS A 4.

Valabhi in 629 and that of Someśvara in the eleventh or twelfth century; equally attesting to its popularity in Western India in the eighth and early ninth centuries is its use by Arabic astronomers of the period, who call Āryabhaṭa Arjabhar.³⁴ Al-Bīrūnī, however, while he possessed a copy of the A in the Panjāb in the 1020's, was confused about its identity.³⁵ The later Indian commentators on the A, almost all of its manuscripts, and most of the texts following the Āryapakṣa³⁶ come from South India. The Sanskrit commentaries in addition to those named above were composed by Sūryadeva Yajvan, who was born in 1191, at Gaṅgāpura in Cola country; by Parameśvara³⁷ in about 1450 at Aśvatthagṛāma in Kerala; by Yallaya at Skandasomeśvara in Āndhrapradeśa in 1480; by Nilakaṇṭha³⁸ in Kerala shortly after 1501; by Raghunātha Rāja at Ahobila in Āndhrapradeśa in 1597; by Bhūtiṣṇu,³⁹ probably near Kāñci in Tamilnadu; and by Ghaṭigopa⁴⁰ in Kerala in about 1800. There are also commentaries in Telugu and Malayālam and a translation into Marāṭhī.

Āryabhaṭa wrote a second work that formed the basis of the Ārdharātrikapakṣa, apparently entitled Āryabhaṭasiddhānta. This is now lost, though a number of astronomers have mentioned its views, and some commentators—especially on the Sūryasiddhānta—have quoted its verses.⁴¹ Especially prevalent in these quotations are verses describing Āryabhaṭa's simple and crude observational instruments (e.g., by Mallikārjuna Sūri⁴² and by Tammayajvan⁴³) and his clepsydras (by Tammayajvan and by Rāmakṛṣṇa). The first treatise to follow the Ārdharātrikapakṣa of the Āryabhaṭasiddhānta was a revised version of the Sūryasiddhānta. This was composed by a pupil of Āryabhaṭa named Lāṭadeva⁴⁴ according to the information available to al-Bīrūnī; and there is no good reason to doubt this attribution. As summarized by Varāhamihira in the PS it is a *karana* rather than a *siddhānta*; its epoch is midnight 20/21 March 505. It is nuclear whether this form is that of Lāṭadeva's original, or was imposed on it by Varāhamihira.

⁴² CESS A 4.

⁴³ CESS A 3, 85a–86a.

⁴⁴ PS ed. NEUGEBAUER–PINGREE, vol. 1, pp. 12–15; A with the commentary of Bhāskara ed. SHUKLA, pp. 1xi–1xiv.

The earliest extant *siddhāntas* to adhere to something approaching the classical form belong to the Āryapakṣa. They were composed by that Bhāskara who commented on the A at Valabhi in 629; of these the Mahābhāskariya⁴⁵ was written before the Āryabhaṭīyabhāṣya which quotes from it under the title Karmanibandha (pp. 33, 40, 131, 179, 203, 204, 205, and 225–226), while the Laghubhāskariya⁴⁶ summarizes the MB, and probably postdates the Āryabhaṭīyabhāṣya (and the BSS).

An arrangement less rigid than that of the classical *siddhānta* is evident in the contents of the MB's eight chapters:

1. *ahargaṇa*; mean longitudes; planetary *kuttaka*.
2. *deśāntara* correction.
3. spherical trigonometry; catalogue of stars.
4. planetary equations (including the model involving a concentric with equant); *tithis*, *karaṇas*, *nakṣatras*, *pātas*, and *yogas*.
5. solar and lunar eclipses.
6. first visibility and illumination of the Moon; first and last visibilities of the planets; planetary conjunctions.
7. parameters of the Āryapakṣa and of the Ārdharātrikapakṣa.
8. examples.

The arrangement of the eight chapters of the LB, which is probably influenced by that of the Daśādhyāyī of the BSS, represents the first stage of the fully developed form:

1. *ahargaṇa*; mean longitudes; *deśāntara* correction (*madhyama*).
2. planetary equations; *nakṣatras*, *tithis*, *karaṇas*, and *pātas* (*spaṣṭa*).
3. spherical trigonometry (*tripraśna*).
4. lunar eclipses (*candragrahaṇa*).
5. solar eclipses (*sūryagrahaṇa*).
6. first visibility and illumination of the Moon (*śṛṅgonnati*).
7. first and last visibilities and conjunctions of the planets (*udayāsta* and *grahayuti*).
8. catalogue of stars; conjunctions of planets with stars (*bhagrahayuti*).

Both of these *siddhāntas* were, like most Āryapakṣa works, popular only in South India; it is there that most of their manuscripts were copied, and their commentaries written. These commentaries include that composed by Govin-

⁴⁵ Edited with the commentary, Karmadīpikā, of Parameśvara by B. D. APATE, ASS 126, Poona 1945; with the Bhāṣya of Govindasvāmin and the super-commentary, Siddhāntadīpikā, of Parameśvara by T. S. KUPPANNA SASTRI, Madras GOS 130, Madras 1957; and with an English translation and commentary by K. S. SHUKLA, Lucknow 1960.

⁴⁶ Edited with the commentary, Pārameśvara, of Parameśvara by B. D. APATE, ASS 128, Poona 1946; with the Vivaraṇa of Saṅkaranārāyaṇa by S. VENKATA-SUBRAMONIA IYER and S. KOCHUKANJU ASARI, TSS 162, Trivandrum 1949; and with an English translation and commentary by K. S. SHUKLA, Lucknow 1963.

dasvāmin⁴⁷ (ca. 800–850) in Kerala on the MB, that written by his pupil, Śaṅkaranārāyaṇa, at Kollapurī, Kerala, in 869 on the LB, that composed by Udayadivākara⁴⁸ in 1073 on the LB, and those composed by Parameśvara (ca. 1380–1460) in 1408 on the LB and after 1443 on the MB; Parameśvara also wrote after 1432 a super-commentary on the Mahābhāskariyabhāṣya of Govindasvāmin.

Bhāskara's contemporary rival as an astronomer was Brahmagupta,⁴⁹ who was born in 598 and completed his Brāhmasphuṭasiddhānta⁵⁰ in 628 at Bhillamāla in Rājasthāna during the reign of the Cāpa (Cāvoṭaka) monarch Vyāghramukha. The BSS, which belongs to the Brāhmapakṣa, was enormously influential on later Indian astronomy as well as on Islamic⁵¹ and Western European.⁵² It consists of twenty-four chapters, to which a twenty-fifth—a *karaṇa*—is appended in many manuscripts. These begin with a Daśādhyāyī (chapters 1–10), which summarizes and expands the teachings of the Pait. The relation to (and possible influence on) the LB will be clear from Table 4. This is followed by a chapter (11) in which Brahmagupta criticizes his predecessors and praises the Brāhmapakṣa (*tantraparikṣā*) and another (12) on mathematics (*gaṇita*). Subject to the *tantraparikṣā*'s animadversions are Āryabhaṭa, the Jainas, Pradyumna, Lāṭadeva, Varāhamihira, Vijayanandin, Viṣṇucandra's Vasiṣṭhasiddhānta, Śrīṣeṇa's Romakasiddhānta, and Siṃha. Additional information concerning those of these authors whose works are lost can be found in the PS, in the Āryabhaṭiyyabhāṣya of Bhāskara, and in several later commentaries (e.g., those of Bhaṭṭotpala on the Bṛhatsaṃhitā and of Pṛthūdakasvāmin on the BSS). The next five chapters of the BSS contain additions and corrections to the Daśādhyāyī: chapter thirteen to chapter one, fourteen to two, fifteen to three, sixteen to four and five, and seventeen to seven. Brahmagupta followed this practice of providing supplementary chapters (*uttara*) in

⁴⁷ CESS A 2, 143b–144a, and A 3, 35b.

⁴⁸ CESS A 1, 56b–57a.

⁴⁹ CESS A 4.

⁵⁰ Edited with his own Sanskrit *ṭīkā* by S. DVIVEDIN, Benares 1902, and with his own Sanskrit and Hindi *ṭīkā*s and excerpts from those of Pṛthūdakasvāmin and DVIVEDIN by R. SARMAN, 4 vols., New Delhi 1966. A new critical edition with the commentary of Pṛthūdakasvāmin, an English translation, and a commentary is being prepared by D. PINGREE.

⁵¹ Based on it was a Mahāsiddhānta which was translated into Arabic as Al-Zīj al-Sindhind al-kabīr in 771 or 773 by Muḥammad ibn Ibrāhīm al-Fazārī; see D. PINGREE, "The fragments of the Works of al-Fazārī," JNES 29 (1970), 103–123. This tradition was also followed by al-Fazārī's contemporary, Ya'qūb ibn Tāriq; see D. PINGREE, "The Fragments of the Works of Ya'qūb ibn Tāriq," JNES 27 (1968), 97–125. See also D. PINGREE, The Thousands of Abū Ma'shar, London 1968.

⁵² Concerning the relation of the Sindhind tradition—particularly in the form of the Latin version of al-Khwārizmī's Al-Zīj al-Sindhind and its commentaries—to the BSS and other Sanskrit works see D. PINGREE, "The Indian and Pseudo-Indian Passages in Greek and Latin Astronomical and Astrological Texts," Viator 7 (1976), 141–195, esp. 151–169.

his Kh also. The last seven chapters of the BSS are more heterogeneous: eighteen is on the *kuṭṭaka*, nineteen on gnomon problems (*śaṅku*), twenty on prosody (*chandas*), twenty-one on cosmology (*gola*), twenty-two on instruments (*yantra*), twenty-three on measurements (*māna*), and twenty-four on the contents of the BSS and on its author (*saṃjñā*). The BSS was particularly popular in North and West India; the scholar who brought its derivative, the Mahāsiddhānta, to Baghdād in 771 or 773 came from Sind, and the two commentaries known to have been written on it were composed in the North. Balabhadra⁵³ wrote his at Kānyakubja, probably under Yaśovarman (ca. 725–750); it is now lost except for fragments preserved by Pṛthūdakasvāmin, Bhaṭṭotpala, and al-Bīrūnī. Pṛthūdakasvāmin⁵⁴ wrote his monumental Vāsānābhāṣya on the BSS at Sthāneśvara (Sthānvīśvara) in Kurukṣetra in the 860's; the commentary on chapters sixteen to twenty, on most of twenty-two, and on twenty-three and twenty-four is lost.

Earlier another astronomer had apparently lived at Sthāneśvara, where, in the eighth century, someone wrote a new Paulīśasiddhānta.⁵⁵ This astronomer, while accepting the planetary parameters of the Ārdharātrikapakṣa and the main division of the Kalpa according to the Āryapakṣa, compromised with *smṛti* (and the Brāhmapakṣa) to the extent of accepting the traditional division of a Mahāyuga. In order to achieve a mean conjunction at the beginning of the current Kaliyuga (which he placed 3,888,000 years after the beginning of the current Mahāyuga), he delayed the beginning of celestial motion 648,000 years so that there would remain 3,240,000 years (three of Āryabhata's *yugas*) before the beginning of the current Kaliyuga. The Paulīśasiddhānta is not extant in its entirety, but many fragments remain in the works of Pṛthūdakasvāmin, Bhaṭṭotpala, al-Bīrūnī, and Āmarāja.⁵⁶

Probably also in the eighth century, though perhaps in the early ninth, Lalla composed his Śiṣyadhīvrddhidatantra⁵⁷ following the Āryapakṣa, but with *bījas* for periods of 250 years subsequent to 498 (the numerators of some of these *bījas* are borrowed from Haridatta, who wrote in 683). Lalla may have lived in Daśapura in Mālava, which he mentions (SDV 2, 9, 10). His approximate date is indicated by his initial *bīja*-period, which ends in 748; by his sharing with the Paulīśasiddhānta and the Sūryasiddhānta the Brāhmapakṣa's divisions of a Mahāyuga while retaining Āryabhata's parameters; and by the new organization of the *siddhānta* that he introduced and that was imitated by Vaṭeśvara, who wrote his VS in 904, and, in part, by Śrīpati⁵⁸ when he wrote his SŚŚ toward the middle of the eleventh century. This new organization of the *siddhānta* retained essentially the contents of the BSS's Daśādhyāyi

⁵⁷ Edited by S. DVIVEDIN, Benares 1886.

⁵⁸ Śrīpati also modelled his Jyotiṣaratnamālā on Lalla's Jyotiṣaratnakośa.

in a first section on computation (*grahagaṇita*), while gathering theoretical and cosmological material in a second section (*gola*). The ŚDV was commented on by Bhāskara⁵⁹ (b. 1114) and by Mallikārjuna Sūri⁶⁰—probably he who commented on the Sūryasiddhānta in 1178 in Sanskrit, and previously in Telugu. Thus Lalla's work, as is to be expected of one belonging to the Ārya-pakṣa, was popular in the South; but the presence of manuscripts in Western India and the references to Lalla in, for instance, Āmarāja's commentary on the Kh, show that it was also studied in Gujārāt and Rājasthāna.

The Saurapakṣa was initiated in about 800 by the unknown author of the "modern" Sūryasiddhānta,⁶¹ who has modified many of the planetary parameters of the Ārdharātrikapakṣa (and thereby of Lāṭadeva's Sūryasiddhānta) while retaining others along with the midnight epoch, and who has taken over from the Brāhmapakṣa the traditional divisions of both the Kalpa and the Mahāyuga, but delayed the beginning of the motions of the planets by 17,064,000 years so that the rotations of each within the remainder of the Kalpa are divisible by four. Other elements in the SS indicate its author's knowledge of Brahmagupta's BSS. The popularity of the work was enormous in all parts of India, but especially in the South and Northeast. Virtually every commentator, however, has rearranged the text, adding and subtracting verses ad libitum; the manuscript traditions of these many recensions, especially the earlier ones, will have to be fully investigated before a clear idea of the exact contents of the original can emerge. The most important of the extant Sanskrit commentators are: Mallikārjuna Sūri,⁶² who wrote a commentary in Telugu before composing his Sanskrit Sūryasiddhāntaṭīkā in 1178; Caṇḍeśvara,⁶³ a Maithila Brāhmaṇa whose Sūryasiddhāntabhāṣya was written in 1185; Madanapāla,⁶⁴ a Mahārājādhirāja of the Ṭāka family, who wrote his

Vāsanārṇava between 1375 and 1400; Parameśvara,⁶⁵ who composed his Sūryasiddhāntavivarṇa in Kerala in 1432; Yallaya, who wrote his Kalpavallī in Āndhrapradeśa in 1472; Rāmakṛṣṇa Ārādhyā, whose Subodhinī was also composed in 1472; Bhūdhara,⁶⁶ who wrote his Sūryasiddhāntavivarṇa at Kāmpilya in 1572; Tamma Yajvan,⁶⁷ who composed his Kāmadogdhrī at Paragīpurī in 1599; Raṅganātha, whose Gūdhārthaprākāśaka was completed in Kāśī in 1603; Nṛsiṃha,⁶⁸ who wrote his immense Saurabhāṣya in the same city in 1611; Viśvanātha, also of Kāśī, who composed his Gahanārthaprakāśa in about 1628; Kamalākara,⁶⁹ another astronomer of Kāśī, whose Sauravāsanā on SS 1–10 was written after 1658; and Dādābhāī,⁷⁰ a Cittapāvana Brāhmaṇa, who composed his Kiraṇāvalī in 1719. The dates of three other commentators, all of whom lived in South India, are unknown; they are Kāmābhaṭṭa⁷¹ (Sūryasiddhāntaṭīkā), Cola Vipāścīt⁷² (Gaṇakopakāriṇī), and Bhūtiviṣṇu⁷³ (Gurukāṭākṣā).

A *siddhānta* in which the influence of both the Āryapakṣa and the Saurapakṣa as well as that of Brahmagupta's BSS are apparent is the Vaṭeśvara-siddhānta⁷⁴ composed by Vaṭeśvara at Ānandapura in Gujarāt in 904; the arrangement of the chapters follows that of Lalla's ŚDV. One of the more interesting sections is that (VS 1, 1, 10) in which Vaṭeśvara criticizes Brahmagupta as Brahmagupta had criticized his predecessors, and especially Āryabhaṭa (BSS 11).

In about 950–1000 a second Āryabhaṭa⁷⁵ wrote a Mahāsiddhānta⁷⁶ in large part based on the Brāhmapakṣa, but beginning the planets' rotations 3,024,000 years after the beginning of the Kalpa in the fashion of the Saurapakṣa and substituting a new set of planetary parameters. He also reports another set of new parameters which he found in a treatise ascribed to Parāśara (MS 1, 2). And, while following Lalla in dividing his work into a *grahagaṇita* and a *gola*

⁷⁵ CESS A 1, 53b–54a; A 2, 15b–16a; and A 4.

⁷⁶ Edited with his own Sanskrit commentary by SUDHĀKARA DVIVEDIN, BSS 36, Benares 1910; the *grahagaṇita* was edited with an English translation by S. R. SARMA, 2 vols., Marburg 1966.

section, he follows Brahmagupta's BSS in including chapters on arithmetic and geometry (2, $2 = 15$) and on the *kuttaka* (2, $5 = 18$) in his *siddhānta*.

Śrīpati, who wrote various works at Rohiṇikaṇḍa (about 150 miles south of Ujjayinī) between 1039 and 1056, followed the Brāhmapakṣa when he composed the *Siddhāntaśekhara*,⁷⁷ though he adds the *bījas* to the planetary mean motions that characterize the later history of this school. He also adds to Brahmagupta's astronomy rules for computing the second component (*udayāntara*) of the equation of time (SSŚ 3, 46) and the evection of the Moon (*sphuṭacaraphala*) (SSŚ 11, 2–4); the latter rule, which has ultimately an Islamic Ptolemaic origin, had previously been given by Muṇjāla. Śrīpati arranged the twenty chapters of the SSŚ in much the same order as Lalla's ŚDV, though without the latter's division into two sections and with the addition of two chapters (13 and 14) on arithmetic and geometry (*vyakta-gaṇita*) and on algebra (*avyakta-gaṇita*) respectively. The commentary, *Gaṇita-bhūṣaṇa*, composed by Makkibhaṭṭa⁷⁸ in 1377, is preserved only up to 4, 75.

But the most notable *siddhānta* produced in India is the *Siddhāntaśiromaṇi*⁷⁹

⁷⁷ Edited with the commentary on 1–4 of Makkibhaṭṭa and with his own commentary on 5–20 by BABUĀJI MIŚRA, 2 vols., Calcutta 1932–1947.

P. KHĀNĀPURKAR, Mumbai 1911; the *golādhyāya* with the *Mitākṣarā* and a Hindi commentary edited by GIRIJĀPRASĀDA DVIVEDIN, Lucknow 1911, reprinted Ahmadabad 1936; the *gaṇitādhyāya* with Marāṭhī translation and commentary edited by V. P. KHĀNĀPURKAR, Puṇem 1913; *adhyāya* 1 of the *gaṇitādhyāya* with the *Mitākṣarā* and the commentaries of Nṛsiṃha and Muniśvara edited by MURALĪDHARA JHĀ, Benares 1917; the *golādhyāya* with the *Mitākṣarā* and a Bengālī translation edited by RĀDHĀVALLABHA, Calcutta 1921; the *gaṇitādhyāya* with the *Mitākṣarā* and the commentary of Gaṇeśa edited by DATTĀTREYA ĀPAṬE, ASS 110, 2 vols., Poona 1939–41; the *golādhyāya* with the *Mitākṣarā* and the commentary of Muniśvara edited by DATTĀTREYA ĀPAṬE, ASS 122, 2 vols., Poona 1943–52; *adhyāyas* 1–2 of the *gaṇitādhyāya* with the *Mitākṣarā* edited by MURALĪDHARA THAKKURA, KSS 149, Banārasa 1950; and the *gaṇitādhyāya* with the *Mitākṣarā* and the commentary of Muniśvara (the latter not on *adhyāya* 1) edited by KEDĀRADATTA JOŚĪ, 3 vols., Vārāṇasī 1961–64. The *gaṇitādhyāya* was translated into Latin by E. ROER, JAS Bengal 13 (1844), 53–66; the *golādhyāya* was translated into English by L. WILKINSON, revised by BĀPŪDEVA ŚĀSTRIN, BI 32, Calcutta 1861.

written by Bhāskara⁸⁰ at Vijjaḍaviḍa (?) probably in his native Sahyādri north of Devagiri in 1150. Modelled in form on Lalla's ŚDV (though with the addition of a chapter on the trigonometrical functions, *jyotpatti* and of another describing the seasons) the SŚB is the foremost text of the Brāhmapakṣa after the BSS. Bhāskara changes a few parameters minutely, repeats some of the improvements introduced by earlier astronomy such as the equation of time, and presents for the first time the formula for finding $\sin(\alpha + \beta)$,⁸¹ but the most impressive quality of the SŚB is its comprehensiveness. Commentaries on the SŚB were composed by, among others, Bhāskara himself (*Mitākṣarā*); by Lakṣmīdāsa in 1501 (*Gaṇitatattvacintāmaṇi*); by Gaṇeśa⁸² at Nandipura in Gujārāt in the early seventeenth century (*Śiromaniprakāśa*); by Nṛsiṃha⁸³ at Kāśī in 1621 (*Vāsanāvārttika*) and by Munīśvara⁸⁴ at Kāśī before 1638 (*Marīci*).

For approximately 350 years after the composition of the SŚB no important *siddhānta* was written; the learning of astronomers was rather concentrated in commentaries, their ingenuity in *koṣṭhakas*. It was, however, probably during this period that a group of minor *siddhāntas* belonging to the Saurapakṣa, but attributed to deities or sages, were written. These are the Somasiddhānta,⁸⁵ on which a commentary, *Gūḍhārthadīpikā*, was composed by Nṛsiṃha⁸⁶ at Koṇḍaviḍu in Āndhrapradeśa in about 1400; a Vasiṣṭhasiddhānta⁸⁷ which claims to be based on that of Viṣṇucandra; a Vṛddhavasīṣṭhasiddhānta,⁸⁸ which is influenced by the Brāhmapakṣa in its planetary equations; and the Brahmasiddhānta⁸⁹ alleged to be part of a *Śākalyasaṃhitā*.

Brahmā, Sūrya, Soma, Vasiṣṭha, and Pulastya are mentioned as agreeing with his Saurapakṣa parameters in the *Siddhāntasundara*⁹⁰ (1, 1, 25) by Jñānarāja,⁹¹ who wrote this work at Pārthapura on the Godāvārī in 1503; that by Brahmā he means the *siddhānta* belonging to the Śākalyasamhitā is clear from SSJ 2, 1, 3. This work basically follows Lalla's arrangement, but like the SSB it adds an *ṛtuvarṇana* (SSJ 2, 6). A commentary, *Grahaganitacintāmaṇi*, was written by Jñānarāja's son, Cintāmaṇi,⁹² in about 1530.

The influence of Islamic Ptolemaic theory upon Indian astronomy can be traced back to Muñjala in the tenth century, but the translation of Persian astronomical treatises in some number into Sanskrit began only in the sixteenth and seventeenth centuries. The works selected for translation were for the most part the products of the School of Marāgha and its descendant at Samarqand; among the treatises so translated were the *Zij* of Ulugh Beg⁹³ (Jīca Ulugbegi) and al-Qūshjī's⁹⁴ *Risālah dar hay'at* (*Hayatagrantha*⁹⁵). The earliest Sanskrit *siddhāntas* to reflect this Islamic influence were composed at the Mughal court at Delhi by Nityānanda⁹⁶ during the reign of Shāh Jahān; he wrote the *Siddhāntasindhu* for Āsaf Khān in 1628, and the *Siddhāntarāja*⁹⁷ in 1639. While accepting Islamic parameters and models, Nityānanda presents his material in traditional form and puts forth the claim (copied from the Jñānabhāskara) that this astronomy had originally been revealed to the Yavana (Muslim) by the Sun, who was temporarily incarnate as Romaka (a Roman, or perhaps Qāḍi Zādah al-Rūmī). This Indianized presentation failed to convey to Sanskrit scholars the real superiority of Islamic over Indian astronomy, that is its methodology involving both a reliance on carefully planned and executed observations and a concern with the cinematics of the planetary models. Nityānanda's efforts produced no discernible effects.

His contemporaries in Kāśī, however, did not ignore Islamic astronomy, though some were more receptive than others. The two *siddhāntas* written there in the middle of the century follow the Saurapakṣa with some influence from Bhāskara's SSB. Munīśvara,⁹⁸ who had earlier composed the gigantic *Marīci* on the SSB, completed his *Siddhāntasārvabhauma*⁹⁹ in 1646. While willingly accepting some Islamic trigonometry and rather indifferently refer-

ring to certain doctrines of the Pārasīkas (Persians), Munīśvara vigorously attacks the theory of precession,¹⁰⁰ thereby beginning a heated controversy carried on by Raṅganātha, the brother of his rival, Kamalākara, in his Lohagolakhaṇḍana, to which Munīśvara's cousin, Gadādhara,¹⁰¹ replied in his Lohagolasamarthana.¹⁰² Munīśvara wrote his own commentary, the Āśaya-prakāśinī, on the SSBM.

Kamalākara,¹⁰³ who wrote the Sauravāsanā on the SS and completed the Siddhāntatattvaviveka¹⁰⁴ in 1658, while accepting the Saurapakṣa's planetary parameters, was far more receptive to Muslim astronomy as represented by Ulugh Beg and the School of Samarqand.¹⁰⁵ He was, in particular, prone to agree with Muslim (Ptolemaic) notions of the structure of the planetary system, and he presents what is, apparently, the only Sanskrit treatise on geometrical optics (STV 1, 5).

This process of transmitting Islamic astronomy to India was carried much further by the translation of Naṣīr al-Dīn's Arabic version of Ptolemy's Σύνταξις μαθηματικῇ into Sanskrit by Jagannātha¹⁰⁶ at Jayapura in 1732 under the patronage of Savāi Jayasīṃha.¹⁰⁷ The Siddhāntasamrāt¹⁰⁸ continues after the thirteenth book of Ptolemy with supplements describing the instruments that Jayasīṃha had set up in his observatories in imitation of those installed by Ulugh Beg at Samarqand, and an exposition of Ulugh Beg's and al-Kāshī's derivations of sines, followed by remarks on the traditional aspects of Indian astronomy that were not touched upon by Ptolemy.¹⁰⁹ This last effort to expound Ptolemaic astronomy in Sanskrit was also doomed to fail; a century later, modern European astronomy was being taught in Sanskrit at Sihore by Somanātha Vyāsa¹¹⁰ and other paṇḍits of the Sihore High School¹¹¹ in the 1830's and 1840's under the influence of Englishmen such as Lancelot Wilkinson. The process of Westernization was practically complete by the time Premavallabha¹¹² wrote his Paramasiddhānta¹¹³ at Jayapura in 1882.

Karaṇas

Karaṇas outside of South India are distinguished from *siddhāntas* by their emphasis on pragmatic rules for computing and their avoidance of astronomical theory. One way in which this practical bent is most obviously manifested is by the elimination of reliance on the theory of the Kalpa or of the Mahāyuga in determining the mean motions of the planets; their mean longitudes are rather computed from their positions at a given epoch close in time to the date of the composition of the *karaṇa*, and the longitudes of the planets' apogees and nodes (except for the Moon's) are considered to be fixed. Before the Kh, of course, both *karaṇas* and *siddhāntas* bore the latter designation.

The earliest *karaṇa* that we know of, as mentioned previously, is the Sūrya-siddhānta of Lātadeva, an Ārdharātriśa text summarized in the Pañcasiddhāntikā; its epoch was 21 March 505, as were also those of Lātadeva's recensions of the Romaka and Pauliśa *siddhāntas* epitomized in the PS.¹¹⁴ Varāhamihira, the author of the PS, was a Maga Brāhmaṇa from Avanti who resided in a village named Kāpitthaka (probably Kāyathā near Ujjayinī¹¹⁵). It has further been suggested that he was connected with the Aulikara court at Daśapura, and in particular with Yaśodharman who was ruling there in 532. In the PS, besides the summaries of the five *siddhāntas* of Pitāmaha, Vasiṣṭha, Romaka, Pauliśa, and Sūrya that we have previously discussed, Varāhamihira includes chapters on spherical trigonometry (PS 4; entitled *karaṇa*), on the first visibility of the Moon (PS 5), on cosmology (PS 13), on instruments and observations (PS 14), and on differences in observed phenomena and time measurements due to such causes as local latitude or longitude and various conventions (PS 15). The PS was one source of the Chinese Chiu-chih li¹¹⁶ written at the T'ang court by Ch'ü-t'an Hsi-ta (Gautama Siddhārtha) in 718.

An abbreviated *karaṇa*, dealing almost exclusively with calendaric matters, spherical trigonometry, and the computation of the positions of the planets, is the Dhyānagrahopādhyāya, preserved in some manuscripts of Brahmagupta's BSS as its last chapter (BSS 25). Its epoch is 21 March 628. Like the

¹¹⁴ The views of T. S. KUPPANA SHASTRI, "The Epoch of the Romaka Siddhānta in the Pañcasiddhāntikā, and the Epoch Longitudes of the Sun and Moon in the Vasiṣṭha-Pauliśa," IJHS 13 (1978), 151–158, are too involved to be argued against here. In general, his solution violates the principles that a lectio difficilior which makes sense is preferable to the lectio faciliior that smells of being a learned emendation, and that modern astronomical computations must not be used to revise a manuscript tradition unless there is some substantial reason to believe that that tradition has misrepresented the author's original and that the original must have been in agreement with the modern computations.

¹¹⁶ K. YABUUTI, "Researches in the Chiu-chih li—Indian Astronomy under the T'ang Dynasty," Acta Asiatica 36 (1979), 7–48.

BSS itself it follows the Brāhmapakṣa, though a new method of approximating all linear and sine-wave functions by multiplying one of each by various simple coefficients is introduced. This and other approximative devices alter the parameters somewhat from those standard to the *pakṣa*.

But the *karāṇa* that set the pattern for this genre was the Khaṇḍakhādyaka¹¹⁷ of Brahmagupta, whose epoch is 23 March 665. The first nine *adhikāras* present the astronomy of the Ārdharātrikapakṣa. The mean motion of each of the planets is presented as on integer number of rotations in a given number of days increased or decreased by a small corrective factor in another, larger number of days; this method was popular in later *karāṇas*. The last six *adhikāras* form the Uttarakhāṇḍakhādyaka; they provide correctives to the first, usually changing the Ārdharātrika into Brāhma parameters. The influence of the Kh was enormous; it remained the standard *karāṇa* of Kāśmīra, Nepāla, and Assam till modern times, but in the medieval period was popular throughout North and West India. In 735 a Zij al-Arkand¹¹⁸ based on it was composed in Sind, and, like the BSS, it was available to al-Bīrūnī¹¹⁹ in the Panjāb in the 1020's. There are extant commentaries written by Pṛthūdakasvāmin (Vivarāṇa) at Shāhāneshvara in 864; by Bhaṭṭotpala¹²⁰ (Cintāmaṇi) in Kāśmīra in 969; by Āmarāja¹²¹ (Vāsanābhāṣya) at Ānandapura in Saurāṣṭra in about 1200; and by Yāmaṭa, Varuṇa, and Śrīdatta. As is normally the case with such practical texts as *karāṇas* and *koṣṭhakas*, virtually every manuscript represents a different recension. Also, as frequently occurs with *karāṇas*, there is a *koṣṭhaka* based on the Khaṇḍakhādyaka, the Khaṇḍakhādyakasāriṇī.¹²²

There is nothing known of *karāṇas* written in the eighth and ninth centuries, though presumably the genre did not totally disappear. Nor do we possess any portion in Sanskrit of the Karaṇasāra written by Vateśvara at Ānandapura in 899; that is preserved only in some quotations in the India, Transits, and Al-Qānūn al-Mas'ūdī of al-Bīrūnī.

Al-Bīrūnī also refers in the India to two *karāṇas* by Muñjāla.¹²³ The Bṛhan-

mānasa, whose epoch is 9 March 932, is now lost except for some fragments; but we still possess the Laghumānasa,¹²⁴ which Muñjala composed later at Prakāśa on the Tāpī in Mahārāṣṭra. This small *karāṇa* has drawn elements from both the Āryapakṣa (as corrected by Lalla) and the Ārdharātrikapakṣa; it has also, apparently, derived the notion of the second inequality in lunar motion from an Islamic Ptolemaic source. Though it is a *karāṇa*, the LM does not give epoch positions (apparently one was expected to use those of the Bṛhanmānasa), and its contents are arranged in the form of a *siddhānta*. There are commentaries on the LM written by Praśastadhara (or Praśastidhara)¹²⁵ (Vivṛti) in Kāśmīra in 958; by Sūryadeva Yajvan (Grahajñānavāsanā) in 1248 at Gaṅgāpura in Cola country;¹²⁶ by Parameśvara (Pārameśvara) at Aśvatthagṛāma in Kerala in 1409; and by Yallaya (Kalpalatā) at Skandasomeśvara in Āndhrapradeśa in 1482.

Like the KS of Vaṭeśvara, the Karaṇatilaka composed by Vijayananda (or Vijayanandin) in Vārāṇasī is known to us only through al-Bīrūnī, for whom it was incompetently translated into Arabic in 1026 as the Ghurraṭ al-zijāt.¹²⁷ The epoch of this, the first *karāṇa* of the Saurapakṣa, is 23/24 March 966.

In the early eleventh century the court of Bhojarāja,¹²⁸ the Paramāra Mahārāja of Dhārā, produced numerous works of Sanskrit literature. Among them is a *karāṇa* of the Brāhmapakṣa, containing (as does the more or less contemporary SSS) the *bījas* that were utilized by most of the succeeding adherents of this *pakṣa*. The Rājamṛgāṅka, whose epoch is 21 February 1042, is not preserved for us in its original form, as most of the verses quoted from it by, for example, Āmarāja in his Vāsanābhāṣya on the Kh, are not found in the manuscripts.¹²⁹ A version by one Rāma¹³⁰ contains many verses in common with two manuscripts at Baroda,¹³¹ though each of the three versions also contains a number of verses not in the other two. Moreover, all three versions comprise only the first two *adhikāras*: *madhyamagrahāṇayana* and *spāṣṭīkarāṇa*. The RM is sometimes accompanied by tables (*sāraṇī*), but these have yet to be investigated.

A popular *karāṇa* belonging to the Āryapakṣa is the Karaṇaprakāśa,¹³² composed by Brahmadeva¹³³ at Mathurā (probably Madurai in South India); its epoch is 11 March 1092. There is a commentary (Vṛtti) by Dāmodara,¹³⁴ who also wrote in West India an Āryatulya based on the A in 1417 and a Sūryatulya based on the SS; and there are undated commentaries by Amareśa¹³⁵ (Vyākhyāna) in Kaṇṇāṭakī; by Govinda¹³⁶ (Vivaraṇa or Vivṛti) on the first two *adhikāras*; by Śrīnivāsa Yajvan (Karaṇaprakāśaprabhā); and by Sampat-kumāra (Vyākhyā). Both the manuscripts of the KP and its commentators come predominantly from South and West India, and especially from Mysore and Mahārāṣṭra.

Śatānanda composed the Bhāsvatī,¹³⁷ a *karāṇa* following the Ārdharātri-kapakṣa, allegedly at Puruṣottama (Puri in Orissa), in 1099. He claims to follow the SS as taught by (Varāha)mihira, but offers far more than is found in the PS; the B is sometimes entitled Pañcasiddhāntikā after its source. As is the case with many of these *karāṇas*, there are numerous recensions of the B; some manuscripts add an Uttarabhāsvatī. The principle commentaries are those composed by Aniruddha¹³⁸ (Śiśubodhini) at Benares in 1495; by Gaṇa-patī¹³⁹ (Vivṛti) in Bengal in about 1500; by Mādhava¹⁴⁰ (Mādhavi) at Kānya-kubja in 1525; by Acyuta¹⁴¹ (Ratnamālā) in the 1530's, probably in Bengal; by Balabhadra¹⁴² (Bālabodhini) at Umānagara in Jumilādeśa, Nepāla, in 1543; by Kuvera Miśra¹⁴³ (Ṭikā) in 1685; by Gaṅgādhara¹⁴⁴ (Udāhṛti) in 1685; by Rāmakṛṣṇa (Tattvaparakāśikā) in 1739; by Kamalanayana¹⁴⁵ in about 1740(?), probably in Mithilā; and by Yogīndra in 1742, apparently also in Mithilā. The distribution of the B's manuscripts and its commentators demonstrates its popularity in North and Northeast India and in Nepal.

But a more popular *karāṇa* in West and Northwest India is the Karaṇakutūhala¹⁴⁶ composed by Bhāskara in the Sahyādri in accordance with the Brāhma-

pakṣa; its epoch is 23 February 1183. There are commentaries composed by Ekanātha¹⁴⁷ (Brahmatulyabhāṣya) at Mahāṇḍanagara, apparently in West India, in about 1370; by Padmanābha¹⁴⁸ (Nārmadī), probably also in West India, in about 1400; by Viśvanātha (Brahmatulyodāharaṇa) at Benares in 1612; and by Sumatihaṛṣa Gaṇi (Gaṇakakumudakaumudī) near the Vindhyādri in 1621. The Karaṇakutūhalaṭīkā of Sodhala was composed before 1462, the date of its unique manuscript copy,¹⁴⁹ and that of Caṇḍidāsa¹⁵⁰ before 1658. There is a set of planetary tables, the Brahmatulyasāriṇī,¹⁵¹ based on the KK.

As in the case of Bhāskara's SŚB, the KK of Bhāskara was followed by several centuries during which no new member of the genre was produced. However, in the early sixteenth century Gaṇeśa¹⁵² at Nandigrāma in Gujarāt wrote the Grahālāghava¹⁵³ or Siddhāntarahasya, apparently based on the Grahakautuka composed in 1496 by his father, Keśava;¹⁵⁴ the epoch of the GL is 18 March 1520. A commentator on the GL, Mallāri, states that Gaṇeśa observed the planets and chose the correct parameters from the Brāhmapakṣa, the Āryapakṣa, and the Saurapakṣa; this story obviously conflicts with the alleged relation of the GL to Keśava's Grahakautuka. In fact, the mean motions of the planets (given for *dhruvāṅkas* of 4,016 days) and their equations are unique to the Gaṇeśapakṣa, of which the GL is the first text as yet available (I have not been able to consult any manuscript of the Grahakautuka). The Gaṇeśapakṣa soon competed with the Brāhmapakṣa in West and North-west India. Commentaries on it were composed by Gaṇeśa's nephew and pupil

Nṛsiṃha,¹⁵⁵ who was born at Nandigrāma in 1548 (Harṣakaumudī); by Mallāri,¹⁵⁶ the son of Gaṇeśa's pupil, Divākara, at Golagrāma on the Godāvarī between 1575 and 1600 (Ṭikā); by Gaṅgādhara¹⁵⁷ in 1586, probably at Tāpara north of Devagiri, his father Nārāyaṇa's residence (Manoramā); by Viśvanātha at Kāśī in 1612 (Siddhāntarahasyodāharaṇa); by Nārāyaṇa¹⁵⁸ at Kāśī before 1635 (Udāhṛti); and by Kamalākara¹⁵⁹ before 1662 (Manoramā). There are many tables based on the GL, many using the ends of the various *dhruvāṅkas* as their epochs.¹⁶⁰

At Akbar's court a *karāṇa* belonging to the Saurapakṣa, the Rāmavinoda,¹⁶¹ was composed by Rāma (or Rāmacandra) for a *bhūpāla* also named Rāma (or Rāmadāsa). Its epoch is 11 March 1590, which is stated to be thirty-five years after the era of Akbar; the epoch of Akbar's "Divine Era," which was introduced on Nawrūz of 1584, was indeed 11 March 1556. A commentary, Rāmavinodadīpikā, was written by Viśvanātha at Kāmpilya shortly after 1602. There is also a *koṣṭhaka* written by Rāma and bearing the same name as the RV.

A far more obscure *karāṇa* is the Laghukarāṇa¹⁶² by Bhāvasadāśiva.¹⁶³ Its epoch is 27 March 1598; it follows the Brāhmapakṣa; and its unique manuscript copy came to London from Gujarāt in 1809.

Somewhat better known is a Saura *karāṇa*, the Sūryapakṣaśaraṇa¹⁶⁴ or Khacarāgama composed by Viṣṇu; its epoch is 7 March 1608. A commentary, Udāharaṇa, was written on it by Viśvanātha already in 1612. The fact that the *karāṇa* belongs to the Saurapakṣa and that it was known to Viśvanātha within four years of its composition makes it likely that Viṣṇu lived in Benares, in which case he was probably the Viṣṇu who instructed Kṛṣṇa,¹⁶⁵ who wrote the Bijāṅkura in about 1600, and was himself the pupil of Gaṇeśa's nephew, Nṛsiṃha.

Another Kṛṣṇa¹⁶⁶ wrote a Karaṇakaustubha¹⁶⁷ following the Gaṇeśapakṣa

at Taṭāka in the Koṅkaṇa under the Marāṭha monarch Śivājī; its epoch is 1653. A comparison of their respective chapter titles will demonstrate how closely the KKK follows the GL, whose system of astronomy it attempted to introduce into Mahārāṣṭra. The paucity of manuscripts suggests that it met with little enthusiasm.

The last *karāṇa* to which allusion must be made is the Karaṇavaiṣṇava¹⁶⁸ of Śaṅkara, which belongs to the Brāhmapakṣa; its epoch is 8 May 1766. Śaṅkara otherwise, in the incomplete manuscript available to me,¹⁶⁹ informs us only that his teacher's name was Nandabhaṭṭa. It is possible that this is the Nandarāma Miśra¹⁷⁰ who wrote various works on astronomy and astrology at Kāmyavana in Rājasthāna between 1763 and 1778; in favor of this tentative identification is the fact that Rājasthāna was one of the places in which the Brāhmapakṣa was popular.

*Koṣṭhakas*¹⁷¹

Closely associated with *karāṇas* in North and West India since at least the twelfth century were astronomical tables (*koṣṭhakas* or *sāraṇīs*) which were intended to facilitate the computation of planetary positions and the cusps of the astrological places for those who cast horoscopes, or that of various calendaric functions such as *tithis*, *nakṣatras*, and *yogas* for the makers of almanacs (*pañcāṅgas*). Tables had much earlier been an integral part of astronomical writings, in which they were versified along with the mathematical formulae. But the composing of tables using numerical symbols arranged in columns was apparently introduced into India as an imitation of Islamic *zījes*. The Indian genius for mathematical computation led them to develop many ingenious ways to present the complex elements of their planetary and calendaric models in tabular forms very different from those in use in Islam, but the ultimate derivation of the idea from the West seems unquestionable.

In fact, the earliest such *koṣṭhaka* concerning which we have any information is apparently the *zīj* composed by Durlabha¹⁷² at Multān in Sind; its epoch is 932. Our only source of knowledge of this *zīj*, however, is al-Bīrūnī's India; and he quotes from the instructions rather than from the tables, which presumably accompanied those instructions if the work was indeed a *zīj*.

Planetary tables in India can be classified into three categories. "Mean linear" arrangements tabulate the increments in the mean longitudes of the planets in successively smaller units of time; the *manda* and *śighra* equations are tabulated separately. This is the form of planetary table employed by Ptolemy and by most of his eastern and western successors. The "true linear" arrangement tabulates the true longitudes of the planets in ideal years at given intervals (*avadhis*). The ideal years assume initial mean longitudes of the planet at equal distances around the zodiac while the initial mean longitude of the Sun is always at Aries 0°; the intervals between the initial mean longitudes that are attested are 3°, 6°, 12°, 13;20° (a *nakṣatra*), and 30°. Mean motion tables in terms of these intervals allow one to locate the planet within this system for any given year. The *avadhis* are normally periods of fourteen days. The "true linear" arrangement seems to be an Indian invention. Finally, the "cyclic" arrangement utilizes the Babylonian goal-year periods (that of Venus is changed from 8 to 227 years). The planet's true longitude for the beginning of each *avadhi* in each year of its goal-year period is entered in the table; after one period the cycle is repeated. The goal-year periods themselves were introduced into Indian astronomy from Islamic in the early seventeenth century;¹⁷³ the "cyclic" tables

¹⁷¹ On astronomical tables see D. PINGREE, SATIUS, SATE, and "On the Classification of Indian Planetary Tables," JHA 1 (1970), 95–108.

¹⁷² CESS A3, 116b.

¹⁷³ D. PINGREE in JHAS 2 (1978), 319–320.

produced in that century and the succeeding two in West and Northwest India combined these goal-year periods with the native tradition of true linear tables.

The planetary tables that have been studied heretofore are as follows.¹⁷⁴

1. The *Grahañāna*¹⁷⁵ by Āśādhara,¹⁷⁶ belonging to the Brāhmapakṣa. Its epoch is 20 March 1132; it is true linear. Apparently written in Gujarāt. Expanding the instructions for using these tables is the *Gaṇitacūḍāmaṇi* composed by Harihara in Gujarāt in about 1580.

2. The *Laghukhecarasiddhi*¹⁷⁷ of Śrīdhara, also belonging to the Brāhmapakṣa. Its epoch is 20 March 1227; it is mean linear. Probably written in Khāndeśa.

3. The *Mahādevī*¹⁷⁸ of Mahādeva,¹⁷⁹ again belonging to the Brāhmapakṣa. Its epoch is 28 March 1316; it is true linear. Written on the banks of the Godāvarī, most probably in Mahārāṣṭra.

4. The *Makaranda*¹⁸⁰ of Makaranda,¹⁸¹ belonging to the Saurapakṣa and including *tithi*, *nakṣatra*, *yoga*, and eclipse as well as planetary tables. Its epoch is 27 March 1478; it is mean linear, and the only set of mean motion tables that is entirely sexagesimal. Written at Kāśī.

5. The *Kheṭamuktāvalī*¹⁸² of Nṛsiṃha,¹⁸³ belonging to the Gaṇeśapakṣa. Its epoch is 31 March 1566; it is true linear. Written at Nandigrāma in Gujarāt.

6. The *Candrārki*¹⁸⁴ and the *Kheṭasiddhi*¹⁸⁵ of Dinakara,¹⁸⁶ belonging to the Brāhmapakṣa. The former deals with the Sun and Moon, the latter with the other planets. Their epoch is 31 March 1578; they are true linear. Written at Bārejya in Gujarāt.

7. The *Grahakaumudī*¹⁸⁷ of Nṛsiṃha, the author of the *Kheṭamuktāvalī* to whose Gaṇeśapakṣa the *Grahakaumudī* also adheres. Its epochs are 31 March 1588 and 31 March 1603; it also is true linear. Written at Nandigrāma in Gujarāt.

8. The *Rāmavinoda*¹⁸⁸ of Rāma, who wrote the Saura *karana* of the same name. Its epoch is 11 March 1590; it is true linear. Written at the Mughal court.

¹⁷⁴ The texts that accompany them are edited by D. PINGREE in a collection entitled *Minor Astronomical Texts in Sanskrit*, shortly to be published in the GOS.

9. The Ravisiddhāntamañjarī¹⁸⁹ of Mathurānātha,¹⁹⁰ belonging to the Saurapakṣa. Its epoch is 29 March 1609; it is mean linear. It includes parallax-tables for use in computing solar eclipses. Probably composed in Bengal.

10. The Grahaprabodha¹⁹¹ of Nāgeśa,¹⁹² which follows the Gaṇeśapakṣa. Its epoch is 5 March 1619, the beginning of *dhruvāṅka* 9; it is mean linear. Written in Gujarāt. There is an *udāharaṇa* by Yādava, in which the example is for 9 December 1663.

11. The Khecaraśighrasiddhi or Grahasāraṇī¹⁹³ of Gaṅgādhara,¹⁹⁴ also belonging to the Gaṇeśapakṣa. Its epoch is 1 March 1630, the beginning of *dhruvāṅka* 10; it is mean linear. It includes tables for computing eclipses. Written at Kāśī.

12. The Grahavidyādhara¹⁹⁵ of Vidyādhara. The tables themselves are not preserved, but Vidyādhara states that they belonged to the Brāhmapakṣa. Its epoch is about 29 March 1638; it is mean linear. Written at Rājakoṭa in Saurāṣṭra.

13. The Jagadbhūṣaṇa¹⁹⁶ of Haridatta, belonging to the Brāhmapakṣa. Its epoch is 31 March 1638; it is the first set of cyclic planetary tables. Written in Mewar, Rājasthān.

14. The Khecaradīpikā¹⁹⁷ of Kalyāṇa,¹⁹⁸ also following the Brāhmapakṣa. Its epoch is 31 March 1649; it is true linear, being an adaptation of the Mahādevī. The fact that two of its verses are derived from the Candrārki of Dinakara support the impression that it was composed in Gujarāt or Rājasthān.

15. The Grahaprakāśa¹⁹⁹ of Devadatta,²⁰⁰ belonging to the Adjusted Saurapakṣa. Its epoch is 28 March 1662; it is mean linear. As his nephew Murāri traveled to Kāśī in order to bathe at Maṇikarṇikā, Devadatta probably did not live in that city; but nothing positive is known concerning his locale.

16. The Khetataraṅgiṇī²⁰¹ of Āpadeva,²⁰² belonging to the Gaṇeśapakṣa. Its epoch is 18 March 1702; it is mean linear. Written at Janasthāna in Mahārāṣṭra.

17. The Grahasiddhi and Bhramaṇasāraṇī of Trivikrama,²⁰³ the tables of which are probably those of the Anonymous of 1704,²⁰⁴ which belong to the

Brāhmapakṣa. Its epoch is 1 April 1704; it is cyclic. Composed at Nalinapura, presumably a locality in Rājasthān.

18. The Gaṇitarāja²⁰⁵ of Kevalarāma Pañcānana²⁰⁶ contains eclipse tables and *tithi*, *nakṣatra*, and *yoga* tables as well as planetary tables; it follows the Adjusted Saurapakṣa. Its epoch is 30 March 1728; it is mean linear. The equations are normed so as to be always positive; this feature was probably borrowed from Islamic tables. Written in Navadvīpa, Bengal.

19. The Grahāgama²⁰⁷ of Govindasūnu,²⁰⁸ belonging to the Gaṇeśapakṣa. Its epoch is 6 February 1773 Julian, which is the beginning of *dhruvāṅka* 23; it is mean linear. Composed at Śīpoṣī, which is presumably a locality in Rājasthān.

A second category of *koṣṭhakas* that were popular in India provides tables for computing the beginnings (and ends) of *tithis* (periods during which the elongation of the Moon from the Sun increases by 12°), *nakṣatras* (periods during which the longitude of the Moon increases by 13; 20°), and *yogas* (periods during which the combined motion of the Sun and the Moon equals 13;20°). The computations of the true instances of the beginnings of *tithis* and *yogas* is made complex by the fact that both of the luminaries have varying velocities, the Sun's dependent on the distance of its mean longitude from a more or less fixed sidereal point (its *mandocca*) and the Moon's on the distance of its mean longitude from a constantly moving point (its *mandocca*). The solutions adopted by various Indian *koṣṭhakakāras* are not yet understood in their totality by the present writer. The *tithis*, *nakṣatras*, and *yogas* themselves needed to be tabulated for the convenience of astrologers computing *muhūrtas* and of the constructors of *pañcāṅgas* which informed the populace of the details of the calendar and the proper times for festivals and the performance of *saṃskāras*.

Several of the planetary tables contain also tables of *tithis*, *nakṣatras*, and *yogas*; these are the Makaranda of Makaranda, the Candrārki of Dinakara, and the Gaṇitarāja of Kevalarāma Pañcānana discussed above. Independent *koṣṭhakas* on this subject include the following:

1. The Śighrasiddhi²⁰⁹ of Lakṣmīdhara, which tabulates functions according to both the Āryapakṣa and the Brāhmapakṣa. Its epoch is 1278, and it was probably composed in the territory of the Yādavas of Devagiri. The Śighrasiddhi was expanded in 1618–1628 by Janārdana²¹⁰ at Saṅgamanera in Mahārāṣṭra; it was also used by Vidyādhara in 1643 at Rājakoṭa in Saurāṣṭra.

2. The Tithikāmadhenu²¹¹ of Mahādeva,²¹² following the Āryapakṣa. Its epoch is 1357, and it was composed at Tryambaka in Mahārāṣṭra.

²¹¹ SATE 82–89.

²¹² CESS A 4.

3. The Daivajñavallabha²¹³ of Sumiśra, belonging to the Ārdharātrikapakṣa (the Khaṇḍakhādyaka). Its epoch is 1447, and it was written in Nepāla.

4. The Tithicintāmaṇi²¹⁴ of Gaṇeśa, the author of the Grahalāghava; naturally it follows his Gaṇeśapakṣa. Its epoch is 1525, and it was written at Nandigrāma in Gujarāt. There are commentaries by Nṛsiṃha, who wrote the Saurabhāṣya on the SS in 1611 and the Vāsanāvārttika on the SŚB in 1621, both in Kāśī; by Viśvanātha, who wrote in Kāśī in 1634; by Vyeṅkaṭa alias Bāpū Caṇḍika, who also wrote in Kāśī; and by Yajñeśvara.

5. The Bṛhattithicintāmaṇi²¹⁵ also by Gaṇeśa and belonging to the Gaṇeśapakṣa. Its epoch is 1552, and it also was composed at Nandigrāma in Gujarāt. There is a commentary, Subodhinī, composed by Viṣṇu, the uncle of the Nṛsiṃha who commented on the Tithicintāmaṇi, in about 1575.

6. The Tithisāraṇi²¹⁶ of Dinakara, the author of the Candrārki and the Khetasiddhi; this work belongs to the Brāhmapakṣa. Its epoch is 31 March 1583; and Dinakara wrote it at Bārejya in Gujarāt.

7. The Tithyādicintāmaṇi²¹⁷ of Dinakara.²¹⁸ Its epoch is 1586, and it was composed at Unnatadurga (Junāgaḍh in Saurāṣṭra).

8. The Tithikalpadruma²¹⁹ of Kalyāṇa,²²⁰ also following the Brāhmapakṣa. Its epoch is 31 March 1605, and it was composed at Maṅgalapura in Saurāṣṭra.

9. The Camatkārasiddhi²²¹ of Virasiṃha,²²² one of the astronomers working for Anūpasīṃha,²²³ the Mahārāja of Bikāner from 1674 to 1698. Its epoch is 1627.

10. The Pañcāṅgavidyādhari²²⁴ by Vidyādhara, the author of the Graha-vidyādhara; like Lakṣmīdhara's Śiṅhrasiddhi, much of which it copies, it tabulates functions according to the parameters of both the Āryapakṣa and the Brāhmapakṣa. Its epoch is 1643; it was composed for Virabhadra, the *rājā* of Rājakoṭa in Saurāṣṭra.

11. The Candrārki²²⁵ of Acalajit,²²⁶ which transforms the tables of Dinakara

²¹³ I have used IO 3283e, the apparently unique manuscript.

from the Brāhmapakṣa to the Saurapakṣa. Its epoch is 1655; Acalajit wrote at Muraripupura in Gujarāt.

12. and 13. The Tithidarpaṇa²²⁷ and Laghutithidarpaṇa²²⁸ of Murāri.²²⁹ The former cannot be dated, but the latter, based on the Makaranda of Makaranda, a text belonging to the Saurapakṣa, has as its epoch 1665, and was composed in Kāśī.

14. The Jayavinodasāraṇi²³⁰ ascribed to Savāi Jayasiṃha, the Mahārāja of Jayapura who sponsored Jagannātha's Siddhāntasamrāt in 1732. Its epoch is 1735.

15. The Pattraprakāśa²³¹ of Viśrāmaśukla, belonging to the Adjusted Saurapakṣa. Its epoch is 1750, but it seems to have been composed in 1777, in Kāśī. It appends true-linear planetary tables to those for *tithis*, *nakṣatras*, and *yogas*.

A final class of astronomical tables includes those designed for use in computing lunar and solar eclipses. Such tables are embedded in the Grahasāriṇi of Gaṅgādhara and the Gaṇitarāja of Kevalarāma, which have already been described. The only set of tables devoted exclusively to the subject of eclipses would seem to be the Karaṇakesarī²³² of Bhāskara.²³³ Its epoch is 1681, and it was composed at Saudamika, evidently a locality in Gujarāt. However, specialized treatises on eclipse computations—e.g., the Parvadvayasādhana of Mallāri—frequently include versified tables; such texts are described more fully below.

The *koṣṭhakas* described in the preceding pages come mostly from western India with a few representatives of a tradition in Kāśī and Bengal. This bias reflects a real situation in the history of Indian astronomy to which we have previously referred—that is, the influence of the Islamic *zīj* on the Indian *koṣṭhaka*. However, other parts of India were not without such tables, though those known to me tend to be late.²³⁴ Moreover, the next section of this chapter will describe texts containing versified tables used in South India in imitation of those found in *siddhāntas* and *karaṇas*. It was generally in this form that astronomical functions were tabulated in those parts of India not subject to a direct and profound Islamic influence.

*South Indian Astronomers*²³⁵

The Dravidian speaking areas of the Indian peninsula—Āndhrapradeśa, Karnāṭaka, Tamilnadu, and Kerala—developed traditions of astronomy (and mathematics) based on the Ārya and Saura *pakṣas*, but largely independent of the traditions in the rest of India; this insularity was particularly true of Kerala, where some of the most brilliant work ever to be done in India in mathematics was produced in the fourteenth and fifteenth centuries without having any effect whatsoever on the north. In the south in particular developed three interrelated systems: the Parahita and Vākya following the Āryapakṣa, and the Dṛggaṇita following the Saurapakṣa. Further, a genre of literature called *tantra* or *kaṛaṇa* evolved in which the author could deal with selected topics in astronomy rather than giving a complete system as a *siddhānta* or northern *kaṛaṇa* would. Alongside these texts, which are collections of problems, there were written short essays dealing with single facets of astronomy. To some extent, as we shall see, such essays were also composed in the north, but never in the numbers in which they were written in Kerala.

The Parahita system was first embodied in the Grahacāranibandhana²³⁶ of Haridatta. Traditionally the date of the inception of the system was 683; since Haridatta is already quoted as an authority of Govindasvāmin in his Prakāṭhārthadīpikā, written in the first half of the ninth century, 683 is not an unreasonable date for Haridatta. The GCN versifies the mean daily motions of the planets according to the Āryapakṣa, the sines of their equations at intervals in the argument of 3;45° (he calls these tables *vākyas*), the *śighra* anomalies necessary for first and last stations, and the mean longitudes of the planets on 20 March 355; all of the numbers are expressed by the *kaṭapayādi* system. In another work—probably the lost Mahāmārganibandhana—Haridatta gave *bīja* corrections to the mean yearly motions of the planets, to be applied to the years following 522.

Following the Parahita system, and thereby the Āryapakṣa, are the *vākyas*. These are based on the synodic periods of the five planets and cycles based on those periods, and, in the case of the Moon, on cycles of its anomalistic period; within each synodic period true longitudes at regular time intervals are given, and in the smallest lunar cycle daily longitudes of the Moon are given.

The earliest attested epoch of the lunar *vākyas* is 1184. The *vākyas* themselves, called Candravākyaṇi²³⁷ and attributed to Vararuci, use the relation: 9 anomalistic months = 248 days. The larger cycles of the system are: 110 anomalistic months = 3031 days, and 449 anomalistic months = 12,372 days. The two

²³⁵ The most recent general treatment of South Indian astronomers, astrologers, and mathematicians is K. V. SARMA, *A History of the Kerala School of Hindu Astronomy*, VIS 55, Hoshiarpur 1972.

²³⁶ Edited by K. V. SARMA, Madras 1954.

²³⁷ Edited by C. KUNHAN RAJA, Madras 1948.

smaller cycles had already been given by the Vasiṣṭhasiddhānta known to Varāhamihira (PS 3, 8–9); the first is ultimately Babylonian. Several Sanskrit poems composed in Kerala contain, embedded in their verses by means of the *kaṭapayādi* system, Vararuci's lunar *vākyas*; the most notable of these is the *Haricarita*²³⁸ composed by Parameśvara²³⁹ in the fifteenth century, in which the life of Kṛṣṇa provides the surface meaning for the versified astronomical tables. These *vākyas* were still in use in south India in modern times. They were described by John Warren in 1825²⁴⁰ as part of a discussion of the *pañcāṅga*-computations; in this form, and misnamed "Tamil," they generated some interest among non-Indian historians of science in the 1950's and 1960's.²⁴¹

The planetary *vākyas* are given in an anonymous text entitled *Vākyakaraṇa*,²⁴² in which the epoch of the lunar *vākyas* is 22 May 1282; the text seems to have been composed in about 1300, probably near Kāñci. There is a commentary composed by Sundararāja, who was a native of Viprasadgrāma (Andaṇa-nal-lur near Trichinopoly), in the late fifteenth or early sixteenth century; Sundararāja studied under Padmagarbha during the reign of (Gopendra) Tipparāja,²⁴³ who ruled Koṇḍaviḍu in the Guntur District for the Vijayanagara king, Kṛṣṇadeva Rāya, from about 1515 till 1520, and he corresponded with the well-known astronomer, Gārgyakerala Nilakaṇṭha Somayājīn, whom we shall presently discuss in more detail.

Before turning to the most important school of Kerala astronomers, I should mention the first text in a genre, the *tantra*, cultivated exclusively in south India. A *tantra* is like a *karāṇa* in its emphasis on pragmatic solutions to particular astronomical problems—sometimes only to those that were regarded as needing a special treatment. But since it follows the Āryapakṣa, in which there is a mean conjunction of all the planets at the beginning of the current Kaliyuga (6 A.M. at Laṅkā on 18 February—3101), a *tantra* uses that date as its epoch rather than a date closer in time to the author's.

The earliest such *tantra* is the *Vārṣikatantra*²⁴⁴ written by Viḍḍaṇa or Viddaṇa. His own name and that of his father, Mallaya, indicate a Dravidian origin, probably in Mysore whence most of the manuscripts of his work come. The

²⁴³ CESS A2, 133b.

²⁴⁴ I have used the manuscript Harvard 1113 (Poleman 4391), in which II 5–III 10 are missing.

Vārṣikatantra was written before 1370 since it is quoted by Ekanātha in his commentary on Bhāskara's KK. It consists of eleven *adhyāyas* in a somewhat unusual order: *dhruvamadhyā* (= *madhyama*), *grahagatinirṇaya* (= *sphuṭa*), *chāyā* (= *tripraśna*), *candragrahaṇa*, *sūryagrahaṇa*, *valilekhana* (= *parilekha*), *mahāpāta*, *udayāstamaya*, *grahayuti*, *bhagrahayuti*, and *śṛṅgonnati*. A manuscript was acquired in the Karṇāṭaka and brought to Bikāner in Rājasthān by the Mahārāja Anūpasimha²⁴⁵ in about 1675; there the work was revised by the court astronomer, Vīrasimha, in 1678, and a set of *koṣṭhakas* calculated for it.

But the most important school of astronomers from south India was founded by its most brilliant member, Mādhava²⁴⁶ of Saṅgamagrāma (near Cochin in Kerala), in the late fourteenth century. His most ingenious work was done in the investigation of the series that express the value of π and of other trigonometrical functions used in astronomy; this achievement is discussed more fully in the chapter on mathematics. The surviving astronomical works of Mādhava are for the most part concerned with refinements of the *vākya* system. They include, on the lunar *vākya*s, the Sphuṭacandrāpti;²⁴⁷ its elaboration, the Veṅvāroha,²⁴⁸ whose epoch is 1403; and a new set of Candravākyaṇi²⁴⁹ giving daily longitudes of the Moon correct to the second sexagesimal place instead of to the first as in the Candravākyaṇi of Vararuci. The idea of the Sphuṭacandrāpti and the Veṅvāroha is to utilize the cyclic nature of the lunar *vākya*s, in which nine anomalistic months equal 248 days, to determine easily the lunar longitude at nine equally distant times in one day. A Malayālam commentary was written on the Veṅvāroha by Acyuta Piṣāraṭi²⁵⁰ in the early seventeenth century. On the computation of the longitudes of the planets Mādhava wrote a Madhyamānayanaprakāra and an Aṅgītagrahaṇacāra, the latter apparently in 1418. He also composed a Lagnaprakaraṇa on computing the ascendant. None of these has yet been published.

Mādhava's most distinguished pupil was that Parameśvara of Aśvatthagṛāma in Kerala whom we have already encountered as a commentator on Āryabhaṭa's A; on Bhāskara's MB and LB (the latter in 1408); on the SS in 1432; on Govindasvāmin's Mahābhāskariyabhāṣya in 1432; and on Muñjāla's LM in 1409. He made a series of observations of eclipses of the Sun and the Moon between 1393 and 1432.²⁵¹ These should have influenced his Grahaṇamaṇḍana,²⁵²

whose epoch is 15 July 1411; his *Grahaṇanyāyadīpikā*;²⁵³ and his *Grahaṇāṣṭaka*.²⁵⁴ Such an influence, however, is not clearly discernible. Parameśvara's main importance in planetary astronomy in south India was through his *ḍṛggaṇita* system, expounded in the *Ḍṛggaṇita*²⁵⁵ of 1431. In this the mean motions (with slight modifications in the cases of the lunar *mandocca* and node) were taken from the Saurapakṣa, though the mean planets were assumed not all to be at Aries 0° at the beginning of the Kaliyuga; the longitudes of the *mandoccas* (except for Saturn's) are derived from Muñjāla's LM; and the dimensions of the *manda* and *śīghra* epicycles are new. Parameśvara also wrote two *Goladīpikās* in which he discusses general astronomical and geographical theories; the first²⁵⁶ of these was written in 1443 and is accompanied by a commentary composed by the author himself, the second²⁵⁷ was composed toward the end of his life, probably in the 1450's.

A student of Parameśvara's son and student, Dāmodara, was Gārgyakerala Nīlakaṇṭha Somayājīn, one of the commentators on Āryabhaṭa's A. Nīlakaṇṭha was born on about 14 June 1444 at Kuṇḍapura near Tirur in Kerala; in the Āryabhaṭīyabhāṣya (on Kālakriyā 12–15) he refers to his observation of solar eclipses in 1467 and 1501. Nīlakaṇṭha made several efforts to establish new parameters for the mean motions of the planets (most of his parameters for the other elements of the planetary models are taken from the Āryapakṣa or the Saurapakṣa). The first set of new parameters is found in the *Tantrasaṅgraha*²⁵⁸ composed in 1501, and in abbreviated form in the *Golasāra*;²⁵⁹ the commentaries on the *Tantrasaṅgraha*—the *Yuktidīpikā* and the *Laghuvṛtti*, both written by Nīlakaṇṭha's student, Śaṅkara, in about 1550—are important for the transmission of Mādhava's work on power series. The second set is presented in the *Siddhāntadarpaṇa*,²⁶⁰ on which Nīlakaṇṭha composed his own commentary. Nīlakaṇṭha also wrote a small work, the *Candracchāyāgaṇita*,²⁶¹ on computing the Moon's shadow; it also is accompanied by a commentary from the author's own hand. But his most fascinating work, and one that is apparently unique in the history of Indian astronomy, is the *Jyotirmīmāṃsā*²⁶² that he wrote in 1504. In this treatise Nīlakaṇṭha vigorously defends the necessity

constantly to correct astronomical parameters on the basis of observation, especially with regard to eclipses, but also with regard to the planets other than the Sun and the Moon; this defense is clearly aimed at the efforts in this direction made not only by Nilakaṇṭha himself, but also by his *paramaguru*, Parameśvara.

Another pupil of Parameśvara's son, Dāmodara, was the famous author of the Malayālam Yuktibhāṣā, Jyeṣṭhadeva;²⁶³ and among his pupils was Acyuta Piṣāraṭi of Kuṇḍapura in Kerala, the author of the Malayālam commentary on Mādhava's Venyāroha whom we have previously mentioned. Acyuta, who died on 7 July 1621 at the age of about seventy, was a prolific author on astronomy. On planetary theory, eclipses, and the *pātas* of the Sun and the Moon he wrote before 1596 a Karaṇottama with a *vivarāṇa*.²⁶⁴ His Sphuṭanirṇayatantra²⁶⁵ deals not only with the computation of the positions of the planets, but also with the constellations and with the celestial and terrestrial spheres; on this also Acyuta wrote his own commentary. On eclipses he composed in 1593 an Uparāgakriyākrama (a work of the same title was written by a contemporary Kerala astronomer, Nārāyaṇa,²⁶⁶) and an Uparāgaviṃśati,²⁶⁷ and on the Moon's shadow a Chāyāṣṭaka,²⁶⁸ which attempts to compress the material expressed by Nilakaṇṭha in thirty-two verses in the Candracchāyāgaṇita into the compass of a poem of a quarter of that length. But Acyuta's most unusual work is the Rāśigolasphuṭānīti²⁶⁹ in which he expounds a method for reducing the Moon's longitude in its orbit to an ecliptic longitude in accordance with an Islamic tradition initiated by Yaḥyā ibn Abī Maṣṣūr in the 820's.²⁷⁰

More than a century after Acyuta's death (if the interpretation of his *ahargaṇa* as ca. 22 March 1733 is correct) a Somayājīn belonging to the Putumana family (Nūtanagṛha) of Śivapura in Kerala wrote a Karaṇapaddhati,²⁷¹ which discusses the basis for many astronomical and mathematical parameters and computations, including Mādhava's power series and their developments. This Putumana wrote several other astronomical works also, of which the most important is the Nyāyaratna; none of these has been published. This tradition of astronomy in Kerala continued well into the nineteenth century, but the author of the Karaṇapaddhati is the last major figure.

Yantra

The earliest observational instrument in use in India was the *śaṅku* or gnomon, employed to find the cardinal directions in the Śulbasūtras. Since the fourth century B.C. both the *śaṅku* and the *nāḍikā* or outflowing water-clock have been used (with linear zig-zag functions) to determine time within the solar year and within any period of daylight. More elaborate uses of the *śaṅku* as an instrument for measuring local time and terrestrial latitude are given in every *siddhānta* and *karāṇa* in the chapter on *tripraśna*; eventually the noon equinoctial shadow cast by the *śaṅku* was used to characterize the latitude of localities mentioned in late medieval geographical lists.²⁷²

Besides the simple *śaṅku* vertical to the plane of the horizon, Varāhamihira (PS 14)²⁷³ describes a hemispherical sun dial, a perforated ring, and a perforated sphere (in each of the last two instruments perforations 180° apart serve as a dioptr). Other instruments mentioned in the *siddhāntas* are basically illustrative, or are elaborate toys; illustrative are the rotating wooden model of the celestial sphere mentioned by Āryabhaṭa (A. Gola 22–23) or the three-dimensional scale models of the Sines of the planets' azimuths and altitudes described also by the same astronomer,²⁷⁴ while his clepsydras in fanciful shapes are examples of toys.²⁷⁵ Many later authors of *siddhāntas* describe these or similar instruments, sometimes in the middle of the text (e.g., MB 3, 56–50), but more often in separate chapters on *yantras* (e.g., BSS 22; ŚDV II 8; SŚŚ 19; and SŚB II 11). The most significant new instrument introduced in these texts composed before the introduction of the astrolabe into India seems to be the *phalaka* or board of Bhāskara (SŚB II, 16–27), which is basically a dial with a gnomon suspended vertically in the plane of the Sun's altitude circle.

The first text to describe the construction and use of the *yantrarāja* or astrolabe in Sanskrit was the *Yantrarāja*²⁷⁶ composed by Mahendra Sūri,²⁷⁷ a Jaina from Bhṛgupura, for Fīrūz Shāh in 1370. A commentary was composed by Mahendra's pupil, Malayendu Sūri,²⁷⁸ in about 1382, and another, the *Vilāsavatī*, by Gopirāja²⁷⁹ in 1540. Mahendra has taken from an unidentified Arabic source not only the rules relating directly to the construction and use of the astrolabe (including a Ptolemaic star-catalogue adjusted for precession), but also a Sine table in which R = 3600 or 1, 0, 0 sexagesimally; a declination

table in which $\varepsilon = 23;35^\circ$; a list of cities (including a number in Islamic lands outside of India) with their latitudes expressed in degrees; and shadow tables for twelve and seven digit gnomons.

After Mahendra a number of other texts describing traditional Indian instruments were composed in Sanskrit, almost all of them in Gujarāt and Rājasthān, but the astrolabe was generally neglected. The earliest of these is the Yantra-ratnāvalī composed in about 1400 by Padmanābha, whom we have mentioned earlier as the author of a commentary of Brahmagupta's Kh. The Yantra-ratnāvalī contains two chapters, each of which describes the construction and use of a single instrument. The first, on the *diksādhana*, is not available to me, but I have been able to consult a manuscript of the second, the *dhruvabhramāṇa*,²⁸⁰ on which Padmanābha himself wrote a commentary. This instrument appears to be an elaboration of Bhāskara's *phalaka*, and is not derived from the Islamic tradition.

A treatise describing a semicircular instrument also derived from the native Indian tradition is the Yantracintāmaṇi²⁸¹ composed by Cakradhara,²⁸² probably in the late fifteenth or early sixteenth century; Cakradhara himself wrote a commentary on this, as did also Rāma (Yantradīpikā) in 1625. In the same Indian tradition are the works on *yantras* composed in the sixteenth century by Gaṇeśa, the author of the GL, at Nandigrāma in Gujarāt; these are the Cābukayantra, of which no copy is available to me, and the Pratodayantra,²⁸³ which is a special form of Sun dial.

Interest in the astrolabe was reawakened in north India in the Mughal period. The Risālat al-uṣṭurlāb of the great thirteenth century Persian polymath, Naṣīr al-Dīn Muḥammad al-Ṭūsī,²⁸⁴ was translated into Sanskrit at some time during this period. In 1615 at Jambūsara in Gujarāt Viśrāma wrote a Yantracintāmaṇi²⁸⁵ in which he describes the astrolabe, the gnomon, the water-clock, the quadrant, and several other instruments. Incidentally, he presents several elements borrowed from Islamic astronomy in addition to the astrolabe: tables of the Sine and Cosine functions at intervals of 1° with $R = 120$; a declination table with $\varepsilon = 23;35^\circ$; and the goal year periods of the planets.²⁸⁶

A more significant adaptation of Islamic instruments was that by Savāi Jayasimha in the 1720's and 1730's, the Mahārāja and founder of Jayapura

whom we have previously mentioned as the author of a *koṣṭhaka*. His monumental stone observatories erected at Jayapura, Ujjayinī, Delhi, Mathurā, and Vārāṇasī in imitation of Ulugh Beg's at Samarqand have often been described, though first by his learned *paṇḍita*, Jagannātha.²⁸⁷ He also wrote a prose treatise on the construction and use of the astrolabe, the *Yantrarājaracanā*;²⁸⁸ there is a versification of this, the *Yantraprabhā*²⁸⁹ of Śrīnātha. Though a number of Sanskrit astrolabes made in north India in the eighteenth and nineteenth centuries survive, the only other extant Sanskrit texts on instruments written after 1500 are the *yantrādhyāyas* of the SSJ (II 5), the SR (II 3), and the SSBM (II 2). The topic of the development of Indian astronomical instruments is one worthy of much fuller scholarly investigation than has hitherto been devoted to it.

Mīśraka

In this section I intend to discuss briefly some minor Sanskrit texts on astronomy that do not fall into any of the normal categories. Most of these deal with one or several aspects of solar and lunar theory, and are related directly or indirectly to the production of *pañcāṅgas* or calendars.

The earliest of these texts is the *Dhikotīda*²⁹⁰ composed by Śrīpati, the author of the *Siddhāntaśekhara*, in 1039; in it are succinctly described the computations of lunar and solar eclipses. There are commentaries written by Dinakara²⁹¹ in 1608 and by Harikṛṣṇa in ca. 1715.

A younger contemporary of Śrīpati was Daśabala,²⁹² a Buddhist who composed a *Cintāmaṇisāraṇikā*²⁹³ in 1055 during the reign of the Paramāra Bhoja. This treatise deals with the various elements—*tithis*, *nakṣatras*, *yogas*, etc.—of a *pañcāṅga*. A commentary was written by Mahādeva²⁹⁴ in 1258.

Several centuries later, in 1522, Gaṇeśa, the author of the GL, wrote a brief *Pātasādhana*²⁹⁵ accompanied by tables that allow one to compute the times of

²⁸⁷ See his *Yantrādhyāya* in R. S. SHARMA's edition of the *Siddhāntasamrāṭ*, vol. 2, pp. 1031–1048.

²⁸⁸ Edited by KEDARNATH, "Śrīmanmahārājādhirājāsrijayasīmhaviracitā Yantrarājakārikā," *The Pandit* (Jaipur) 1, 1924, art. 2, with, as art. 3, the English translation published originally by A. H. GARRETT and C. GULERI in their *The Jaipur Observatory and its Builder*, Allahabad 1902; and edited with the *Yantraprabhā* of Śrīnātha by KEDĀRANĀTHA, RPG 5, Jayapura 1953.

²⁸⁹ Edited by KEDĀRANĀTHA on pp. 17–19 of his edition of the *Yantrarājaracanā*.

²⁹⁰ Edited by N. K. MAZUMDAR, "Dhikotīkaraṇa of Śrīpati," *Calcutta Oriental Journal* 1 (1934), 286–299, and by K. S. SHUKLA, Lucknow 1969.

occurrence of the two *pātas* of the Sun and the Moon, *vaidhṛta* and *vyatīpāta*. Commentaries on the *Pātasādhana* were composed by the Divākara who also commented on the *Makaranda* in the early seventeenth century, by Divākara's cousin, Viśvanātha, and by Dinakara²⁹⁶ at Poona in 1839.

A work on solar and lunar eclipses, the *Parvadvayasādhana*,²⁹⁷ was written by Mallāri²⁹⁸ in about 1588; this makes plausible his identification with the commentator on Gaṇeśa's GL. To a large extent the *Parvadvayasādhana* consists of versified tables of variables necessary for the computation of the phases, durations, and magnitudes of eclipses. Commentaries were composed on it by Viśvanātha in the early seventeenth century, and by Kṛṣṇanātha Dvivedin²⁹⁹ at Vārāṇasī in 1787.³⁰⁰

In about 1600 one Bābā,³⁰¹ the son of Rāma and the younger brother of Śiva, wrote a *Pañcāṅgasiddhi*³⁰² in which he gives annual increments for *tithis*, *nakṣatras*, *yogas*, and the week-days on which sidereal years begin for a period of 90 years.

Viṣṇusiṃha wrote in Nepāla a work on solar and lunar computations, entitled *Siddhāntasāra*, of which parts survive in both Sanskrit and Nevārī;³⁰³ its epoch is Friday 19 March 1624. The same manuscript contains the chapters on solar and lunar eclipses from his *Jyotiḥsāraṅga*.

Perhaps the most interesting of these miscellaneous works is the *Bhaṅgivi-bhaṅgikaraṇa*³⁰⁴ composed by Raṅganātha at Kāśī in about 1650 in defense of his brother, Munīśvara's, SSBM. In this brief treatise Raṅganātha discusses in detail planetary models and computations, with critical comments on various aspects of the theories of the *Paitāmahasiddhānta*, *Brahmagupta*, the *Sūrya-siddhānta*, *Bhāskara's SSB*, the *Romasasiddhānta*, the *Vasiṣṭhasiddhānta*, the *Somasiddhānta*, *Jñānarāja*, the *Yavanas*, and *Lakṣmīdāsa's* and *Nṛsiṃha's* commentaries on the *SSB*.

Finally, in this section mention should be made of the *Grahalāghavacan-drārki*³⁰⁵ composed by Prajārāma³⁰⁶ in Gujarāt in 1738. This work gives rules for computing the positions of the Sun and the Moon according to the *Gaṇeśa-pakṣa* without resorting to tables.

CHAPTER III

MATHEMATICS

Mathematics¹ is useful to a number of *śāstras* in India as elsewhere—the *śulbasūtras*, astronomy, and astrology, which are discussed in this volume, as well as such subjects as alchemy, medicine, prosody, and philosophy (particularly Jaina). But there also exists a literature directly concerned with mathematics, in particular with arithmetic (especially its commercial and other practical applications), algebra, and geometry. There was never in India a *jāti* of mathematicians, and rarely anything that could be called a school; most mathematicians were *jyotiṣīs* (astronomers or astrologers). Therefore, the mathematical literature consists either in the form of chapters of astronomical *siddhāntas* or of treatises composed, with a few exceptions, by scholars who were also authors of astronomical texts. Moreover, several important branches of Indian mathematics—analemmata and trigonometry, for instance—rarely if ever are treated outside of the astronomical context that endowed them with significance.

Gaṇita

The earliest text of this genre that we have is the first chapter of Āryabhaṭa's A entitled Gaṇitapāda.² In thirty-two verses he deals succinctly with a number of selected topics: the decimal place-value system of numbers; squares and cubes; square-roots and cube-roots; the areas of triangles, rectangles, trapezia, and circles, and the volume of a pyramid;³ chords and sines of arcs of a circle; π ;

¹ Among general works on Indian mathematics, the most useful are: B. DATTA and A. N. SINGH, *History of Hindu Mathematics*, 2 vols., Lahore 1935–1938, reprinted Bombay 1962 (not always reliable); C. N. SRINIVASIENGAR, *The History of Ancient Indian Mathematics*, Calcutta 1967; T. A. SARASVATI AMMA, *Geometry in Ancient and Medieval India*, Delhi 1979; and A. K. BAG, *Mathematics in Ancient and Medieval India*, Varanasi 1979.

² The most recent treatment of the Gaṇitapāda is K. ELFERING, *Die Mathematik des Āryabhaṭa I*, München 1975; see also R. C. GUPTA, "On Some Mathematical Rules from the Āryabhaṭīya," *IJHS* 12 (1977), 200–206; and A. VOLODARSKY, "Mathematical Achievements of Āryabhaṭa," *ibid.*, 167–172.

³ K. ELFERING, "The Area of a Triangle and the Volume of a Pyramid as well as the Area of a Circle and the Surface of the Hemisphere in the Mathematics of Āryabhaṭa I," *IJHS* 12 (1977), 232–236.

shadow-problems; intersecting circles; sums of various series;⁴ solutions to quadratic equations; proportions; and the solution of indeterminate equations of the first degree.⁵ Thus he includes in this chapter on *gaṇita* not only arithmetic, geometry, and algebra, but several topics of primary interest to astronomers—i.e., trigonometry, intersecting circles (for eclipse calculations), and indeterminate equations (for deriving the numbers of rotations of the planets in a Mahāyuga). The solution to the indeterminate equations utilizes continued fractions; continued fractions had been investigated by Euclid, though not applied to the problem of indeterminate equations, so far as we know, by the Greeks. Many useful illustrations to Āryabhaṭa's rules were given by his early commentator, Bhāskara.⁶

This same Bhāskara, in his MB (1, 41), appears to be the first to name the continued fraction method of solving indeterminate equations the "pulverizer" (*kuṭṭakāra*); he applies the "pulverizer" to problems of the planets' mean motions in MB 1, 41–52. In MB 8, 7–25 he sets the student various mathematical problems that arise in astronomy, most of which are intended to exercise his facility in applying the "pulverizer."

Bhāskara's contemporary, Brahmagupta, devotes two *adhyāyas* of his BSS to mathematics. Chapter 12⁷ is the earliest extant formal treatise on arithmetic in Sanskrit. In it he gives succinct rules for twenty arithmetical operations (*parikarma*) and eight determinations (*vyavahāra*). These are listed by Pṛthūdakasvāmin; the *parikarmāṇi* are: addition (*saṅkalita*), subtraction (*vyavakalita*), multiplication (*pratyutpanna*), division (*bhāgahāra*), square (*varga*), square-root (*vargamūla*), cube (*ghana*), cube-root (*ghanamūla*), five⁸ rules for operating with fractions (*pañcajātayaḥ*), the rule of three (*trairāśika*), the inverse rule of three (*vyastatrairāśika*), the rules of five, seven, nine, and eleven terms, and barter (*bhāṇḍapratibhāṇḍa*), while the *vyavahārāḥ* are: mixtures (*miśra*), series (*śreḍhī*), plane geometry (*kṣetra*), (solid geometry, subdivided into) excavations (*khāta*), stacks (*citi*), sawn lumber (*krākacika*), and mounds of grain (*rāśi*), and shadow-problems (*chāyā*). Of special interest

⁵ A. K. BAG, "The Method of Integral Solution of Indeterminate Equations of the Type: $BY = AX \pm C$ in Ancient and Medieval India," IJHS 12 (1977), 1–16.

⁶ K. S. SHUKLA, "Hindu Mathematics in the Seventh Century as Found in Bhāskara I's Commentary on the Āryabhaṭīya, Gaṇita 22 (1971), 1, 115–130, and 2, 61–78; and 23 (1972), 1, 57–79, and 2, 41–50.

⁷ Translated with excerpts from Pṛthūdakasvāmin's commentary by H. T. COLEBROOKE, Algebra with Arithmetic and Mensuration from the Sanscrit, London 1817, repr. Walluf bei Wiesbaden 1973, pp. 277–324.

⁸ Five only are given by Brahmagupta; a sixth is said by Pṛthūdaka to have been described by Skandasena.

is his exhaustive investigation of triangles and quadrilaterals—mostly right triangles and cyclic quadrilaterals (BSS 12, 21–39). Chapter 18 is devoted to algebra, here denominated *kuttaka* after the pulverizer;⁹ it is illustrated by exemplary problems (*udāharaṇa*). Among the topics discussed, in addition to the pulverizer itself, are the mathematics of zero and of surds, quadratic equations, equations with several unknowns, and indeterminate equations of the second degree (*varga-prakṛti*). Brahmagupta's method for solving *varga-prakṛti* equations is not universally applicable. There is no convincing evidence to support the theory that Brahmagupta had a Greek source.¹⁰

Śrīdhara evidently wrote his four works on mathematics between the time of Brahmagupta, whom he gently criticizes without naming,¹¹ and before Govindasvāmin, who quotes a verse from Śrīdhara's *Triśatikā* in the *Prakāṭārthadīpikā* that he wrote in ca. 850.¹² Thus Śrīdhara flourished most probably in the eighth century. Though his work on algebra that was known to Bhāskara¹³ is now lost, there still survive three of his writings on arithmetic; all seem to be epitomes of a longer, lost work entitled *Pāṭiṅaṇita*, *Bṛhatpāṭi*, or *Navaśatī*.¹⁴ The first of the three works is the incomplete *Pāṭiṅaṇita*,¹⁵ of which we have some 251 verses (118 are *sūtras* in *āryā* meter, and 133 are *udāharaṇāni* mostly in *āryā*). Following BSS 12 it divides arithmetic into *parīkarmāṇi* (Śrīdhara adds nine to Brahmagupta's twenty) and *vyavahārāḥ* (Śrīdhara adds the mathematics of zero, which was treated in BSS 18, to Brahmagupta's eight). The work begins with verses on mensuration (*paribhāṣā*). Unfortunately, the unique manuscript breaks off in the middle of the third *vyavahāra* (*kṣetra*). Sharing many verses with this *Pāṭiṅaṇita* is the *Pāṭiṅaṇitasāra* or *Triśatikā*.¹⁶ Despite its second title, this work contains only

⁹ A rearrangement of this chapter with excerpts from an anonymous commentary as found in an India Office Library manuscript, 596 A, was translated by COLEBROOKE, *ibid.*, pp. 325–378.

¹⁰ Most recently supported by B. L. VAN DER WAERDEN, "Pell's Equation in Greek and Hindu Mathematics," *Russian Mathematical Surveys* 31: 5 (1976), 210–225.

¹¹ K. S. SHUKLA, *The Patiganita of Sridharacarya*, Lucknow 1959, pp. xix–xx.

¹² On *uttarabhāga* 14, 97 of Parāśara's *Horāśāstra*.

¹³ *Bījagaṇita* 116 and *granthasamāpti* 2; in the latter verse Bhāskara also names as his predecessors Brahma(gupta) and Padmanābha.

¹⁴ In Śrīdhara's works occur the earliest instances of the technical term *pāṭi* for arithmetic. Various authors have claimed that it refers to the calculating board (see, e.g., B. DATTA, "The Science of Calculation by the Board," *AMM* 35 (1928), 520–529), though others, with good reason, have questioned this meaning (e.g., R. VENKATACHALAM IYER, "Pāṭiṅaṇita and the Hindu Abacus," *MS* 18 (1950), 79–82).

¹⁵ Edited with an anonymous commentary and an English translation by K. S. SHUKLA, Lucknow 1959. There is a Russian translation and commentary by A. VOLODARSKII (and O. F. VOLKOV) in *Fiziko-matematičeskie Nauki v Stranakh Vostoka*, Moskva 1966, pp. 141–246.

¹⁶ Edited by S. DVIVEDIN, Benares 1899; partial English translation by N. RAMANUJACHARIA and G. R. KAYE, *BM* 3, 13 (1912–13), 203–217.

some 180 *āryā* verses, of which 73 are *sūtras* and 107 *udāharaṇāni*. It follows the order of the Pāṭiganita and thereby provides some idea of the contents of *vyavahārāḥ* 4–8; but it fails to discuss the mathematics of zero. The third of Śrīdhara's works is entitled *Gaṇitapañcaviṃśi*, of which a fragment of two folia has recently been discovered.¹⁷ Of this work, written almost exclusively in *śloka*s, there survive 53 verses, of which 20 are *udāharaṇāni*; the section between the inverse rule of three (*vyastatrairāśika*) and the discussion of quadrilaterals in the section on plane geometry (*kṣetra*) is missing.

Perhaps contemporary with Śrīdhara is the work on mathematics preserved in the Bakhshālī manuscript;¹⁸ though some scholars would date it as early as 200 A.D. on the basis of its symbols, its language, its meter, and its references, none of their arguments is very persuasive. The work is earlier than the manuscript, which is written in "early" Śāradā and may therefore have been copied in the eighth, ninth, or tenth century. Arguments based on its relation to extant Sanskrit texts on *gaṇita* appear to me rather unreliable since we have so little from an early period to compare it with, and since it is clearly not in the main tradition of these texts. However, the fact that it is composed of *sūtrāṇi* and *udāharaṇāni* in verse with symbolic statements and prose solutions of the examples as are the works of Śrīdhara makes me believe that it follows the same model as does he. Aside from Āryabhaṭa and Brahmagupta, who did not follow this model, the only mathematicians earlier than Śrīdhara that we know of are Maskari, Pūraṇa, Pūtana, and Mudgala whom the earlier Bhāskara mentions,¹⁹ and Nārmada whom Śrīdhara himself mentions,²⁰ while Lalla was probably contemporary with Śrīdhara.²¹ The tradition, then, of works on *gaṇita* based on the classification into *parikarmāṇi* and *vyavahārāḥ* (the latter are specifically ascribed to Maskari, Pūraṇa, and Mudgala by Bhāskara) was not a very long one; the treatment of rules and examples offered by Śrīdhara and the Bakhshālī manuscript was probably even shorter, though no certain *terminus post quem* can be attached to it. The subjects treated in the Bakhshālī manuscript include the rule of three, series, square-roots, mixtures (*miśra*ka), simultaneous equations, and quadratic equations; presumably the rest of the traditional contents of a work on *gaṇita* once were present when the manuscript was complete.

The earliest influence of Indian mathematics upon Islam presumably was contemporaneous with the earliest translations of Sanskrit astronomical texts

¹⁷ I have used ff. 1 and 3 of G. 111f. in the Wellcome Institute for the History of Medicine.

¹⁸ Edited by G. R. KAYE as ASI, NIS 43, 2 vols., Calcutta 1927–1933. See also, against KAYE, B. DATTA, "The Bakhshālī Mathematics," BCMS 21 (1929), 1–60, and A. A. KRISHNASWAMI AYYANGAR, "The Bakshālī Manuscript," MS 7 (1939), 1–16.

²⁰ Gaṇitapañcaviṃśi, sūtra 23.

²¹ SHUKLA, Pāṭiganita, p. ix.

into Arabic in the eighth century. The first concrete evidence that survives for that transmission is the work on performing arithmetical operations with the ten Indian number symbols written by al-Khwārizmī, probably at Baghdād, in the early ninth century; this is preserved in several recensions of a Latin translation of the early twelfth century.²² A large group of Arabic arithmetics characterized by the use of the Indian number symbols (for both integers and fractions) and the dust board (*takht*) were denominated *al-ḥisāb al-hindī* ("Indian calculation") by their authors. The oldest of these is the *Kitāb al-fuṣūl fī al-ḥisāb al-hindī*, composed by al-Uqlīdisī at Damascus in 952/3.²³ The precise relationship of such mathematical works to Indian texts on *ganita* is not as yet established.

Mahāvīra,²⁴ the most famous of the Jaina mathematicians, wrote his *Gaṇitasārasaṅgraha*²⁵ during the reign of the Rāṣṭrakūṭa Amoghavarṣa, who ruled parts of Kārṇāṭaka and Mahārāṣṭra between ca. 814/15 and ca. 880. In this work he has divided the traditional contents of *ganitasastra* into an opening *saṃjñādhikāra* (*paribhāṣā*, mathematics of zero, and addition and subtraction) and eight *vyavahāras*. The *parikarma* is concerned with multiplication, division, squares, square-roots, cubes, cube-roots, and series; the *kalāsavarṇa* and *prakīrṇaka* with fractions; the *trairāśika* with the rules of three, five, seven, and nine; the *miśraka* with mixtures, the pulverizer, and sums of series; the *kṣetraganita* with plane geometry;²⁶ the *khāta* with solid geometry; and the *chāyā* with shadow problems. The GSS was commented on in Kannaḍa by Daivajñavallabha²⁷ (Bālabodha) and in Sanskrit by Varadarāja. Furthermore, it was translated into Telugu by Pāvulūri Mallana²⁸ in the eleventh century and into Rājasthānī by Amīcandra²⁹ in about 1850.

The second Āryabhaṭa included two chapters on mathematics in the MS that he wrote in about 950–1000. *Adhyāya* 15, the *pāṭyadhyaṃya*, deals with

the traditional topics of arithmetic and geometry in 120 verses, while *adhyāya* 18, the *kuṭṭakādhyāya*, discusses the pulverizer, of whose use it gives many examples, in 70 verses. This treatment is clearly modelled on the BSS.

More closely based on the same prototype, though of shorter extent, are the two *adhyāyas* devoted to mathematics in the SŚŚ composed by Śrīpati in about 1040: *adhyāya* 13, *vyaktagaṇita*, on *pāṭi* in 55 verses, and *adhyāya* 14, *avyaktagaṇita*, on algebra in 37 verses. Many of the verses of SŚŚ 13 appear as *sūtras* in Śrīpati's *Gaṇitatilaka*³⁰ to which many examples (some taken from Śrīdhara) have been added. Unfortunately, however, the *Gaṇitatilaka* does not survive in its entirety. After a *paribhāṣā* modelled on Mahāvīra's, it proceeds in the normal order, though inserting the mathematics of zero in verse 45, in the middle of its treatment of fractions; this mathematics of zero differs from that in SŚŚ 14, 6. The text breaks off in the middle of the *miśrakavyavahāra*. A commentary on the *Gaṇitatilaka* was written by Siṃhatilaka Sūri, the pupil of Vibudhacandra; this Siṃhatilaka wrote a *vṛtti* on the *Bhuvanadīpaka* of Padmaprabha Sūri at Vijāpura in 1269.

Perhaps contemporary with Śrīpati was the mathematician Jayadeva.³¹ Though none of his works are now extant, a quotation in the *Sundarī* composed by Udayadivākara in 1073 proves that he knew the cyclic solution (*cakravāla*) of Pell's equation—that is, of indeterminate equations of the second degree (*vargaprakṛti*) for which Brahmagupta possessed a partial solution. Jayadeva's solution was independently discovered in the West in the seventeenth century.

The second Bhāskara, to whom this *cakravāla* has sometimes been erroneously attributed, wrote two works on mathematics in the middle of the twelfth century. The *Lilāvati*,³² on *pāṭi*, after the usual *paribhāṣā* section on measure-

³⁰ Edited with the commentary of Siṃhatilaka Sūri from a single, incomplete manuscript by H. R. KAPADIA as GOŚ 78, Baroda 1937. The following table illustrates the relationship between SŚŚ 13 and GT:

SŚŚ 13	GT	SŚŚ 13	GT	SŚŚ	GT	SŚŚ	GT
2	15	7	30	14	86	17	111
5	23	9	38	15	97	18	113
6	29	13	83	16	108		

³¹ CESS A 3, 60b, and A 4.

³² The *Lilāvati* was published at Calcutta in 1832; edited by TĀRĀNĀTHA ŚARMAN, Kalikātā 1846; published at Calcutta in 1846, 2nd ed. Calcutta 1876; published at Calcutta in 1852; edited with the *vtvarama* of Mahīdhara and the Telugu *ṭikā* of TAḌAKAMALLA VEṆKAṬA KṚṢṆARĀVA by V. RĀMASVĀMIN SĀSTRIN, Madras 1863; edited by JĪVĀNANDA VIDYĀSĀGARA, Calcutta 1876, 4th ed. Calcutta 1909; edited by SUDHĀKARA DVIVEDIN, Benares 1878; edited with his own Sanskrit *ṭikā* by BĀPŪDEVA SĀSTRIN, Benares 1883; edited by BHUVANACANDRA BASAK, Calcutta 1885; as an appendix to BANERJĪ's edition of COLEBROOK's translation, Calcutta

ment, contains the usual *parikarmas* (adding the mathematics of zero after the discussion of fractions) and *vyavahāras* (adding at the end a section on the pulverizer and one on *anikapāśa* or combinations and permutations). This became the standard textbook on arithmetic in India, as is easily seen from the hundreds of manuscript copies, many editions, various translations, and numerous commentaries. For it was translated into Kannada by Rājāditya,³³ who is said to have been a Jaina from Pāvinabāge at the court at Dorasamudra of the Hoysala Ballāla—presumably Ballāla II (1173–1220); into Persian by Abū al-Fayḍ Fayḍī³⁴ for the Mughal Akbar (1556–1605) in 1587, by Medinī-malla³⁵ in 1663/4, and by Muḥammad Amīn,³⁶ who flourished between 1661 and 1678; and into Hindi by Amīcandra at Jayapura in 1842. Commentaries on the *Līlāvātī* were composed by Parameśvara at Aśvatthagṛāma, Kerala, before 1432 (*vivaraṇa*); by Gaṅgādhara³⁷ at Jambūsaras, Gujārāt, in 1420 (*Gaṇitāmṛtasāgarī*); by Moṣadeva³⁸ before 1472; by the Lakṣmīdāsa who commented on the *SŚB* in 1501; by Sūryadāsa³⁹ at Pārthapura on the *Goḍāvarī* in 1541 (*Gaṇitāmṛtakūpikā*); by the well known Gaṇeśa at Nandigrāma in 1545 (*Buddhivilāsinī*); by Nārāyaṇa⁴⁰ in Kerala in about 1550 (*Karmapradīpikā*); by Śaṅkara, but completed by the above mentioned Nārāyaṇa, in Kerala in about 1556 (*Kriyākramakarī*); by Mahīdhara at Vārāṇasī in 1587; by Munīśvara, the author of the *SSBM*, at Kāśī in the early seventeenth century (*Nisṛṣṭārthadūṭī*); by his contemporary, Raṅganātha, also at Vārāṇasī

1893, 2nd ed. Calcutta 1927; edited with a Marāṭhī *ṭīkā* by V. P. KHĀNĀPŪRKAR, Poona 1897; edited with a Hindi *ṭīkā* by R. S. ŚARMĀ, Bombay 1907; edited by SUDHĀKARA DVIVEDIN as BSS 39, Benares 1912; edited by RĀDHĀVALLABHA, Calcutta 1913; edited with his own Sanskrit *ṭīkā* by MURALĪDHARA TĪĀKURA as HNM 3, Benares 1928, 2nd ed. Benares 1938; edited with the *ṭīkā*s of Gaṇeśa and Mahīdhara by D. ĀPATE as ASS 107, 2 vols., Poona 1937; edited with the *ṭīkā* of Dāmodara Mīśra by D. JHĀ as MSVG 8, Darbhanga 1959; edited with the Sanskrit and Hindi *ṭīkā*s of LAṢAṆA LĀLA JHĀ by S. ŚARMAN as VSG 62, Benares 1961; edited with his own Sanskrit and Hindi *ṭīkā* by SĪTĀRĀMA JHĀ, 4th ed., Benares 1970; and edited with the *ṭīkā* of Śaṅkara and Nārāyaṇa by K. V. SARMA as VIS 66, Hoshiarpur 1975. An English translation by J. TAYLOR was published at Bombay in 1816, and another by H. T. COLEBROOKE in his *Algebra*, with *Arithmetic* and *Mensuration*, London 1817, pp. 1–127; the latter was reprinted by H. C. BANERJĪ, Colebrooke's Translation of the *Līlāvātī*, Calcutta 1893, 2nd ed. Calcutta 1927.

(Mitabhāṣiṇī); by Paraśurāma⁴¹ before 1659; by Rāmakṛṣṇa⁴² at Jalapura in the Sahyādri in 1687 (Gaṇitāmṛtalahari); by Śrīdhara Mahāpātra at Dalapura north of Nilagiri in Orissa in 1717 (Sarvabodhini); by Kṛpārāma⁴³ at Ahma-dābād in about 1790; and by Nilāmbara Jhā,⁴⁴ probably at Alavara in Rājas-thān where he was the court astrologer in the middle of the nineteenth century. To this impressive list of explicators of the Lilāvati could be added many more whose dates are uncertain, or whose names are unknown.

Less popular than the Lilāvati because it is more difficult was Bhāskara's Bijagaṇita.⁴⁵ This, the standard Sanskrit textbook on algebra, describes arith-metical operations involving positive and negative numbers and zero; irrational numbers; the pulverizer (virtually identical with the section on this subject in the Lilāvati); "Pell's equation" (the *vargaprakṛti*); the cyclic solution (*cakravāla*) thereof; various kinds of linear and quadratic equations with one or more unknowns; and equations involving the product of different unknowns (*bhāvita*). The Bijagaṇita was translated into Persian by 'Aṭa' Allāh Rushdī⁴⁶ for the Mughal Shāh Jahān (1628–1659) in 1634/5. It was commented on by Sūryadāsa at Pārthapura in 1538 (Sūryaprakāśa); by Kṛṣṇa⁴⁷ at Vārāṇasī in about 1600 (Bijāṅkura = Navāṅkura = Bijapallava = Kalpalatāvatāra); by Bhāskara⁴⁸ at Rājagiri in 1652 (Śīsubodhana); by Rāmakṛṣṇa⁴⁹ at Jalapura in the Sahyādri in 1687 (Bijaprabodha); by Haridāsa before 1725 (Vāsana-

bhāṣya); by Kṛpārāma at Ahmadābād in 1792 (Bālabodhinī); and by an obscure Nijānanda⁵⁰ (Bijālavāla).

After Bhāskara the next major authority on mathematics was Nārāyaṇa,⁵¹ who completed his Gaṇitakaumudī⁵² in 1356. The GK contains the traditional *paribhāṣā*, *parikarmas*, and *vyavahāras*, followed by the pulverizer, “Pell’s equation,” factors,⁵³ combinations, and magic squares. Before writing the GK Nārāyaṇa had written a work on algebra, the Bijaganitāvataṃsa.⁵⁴ This work covers arithmetical operations involving positive and negative numbers and zero; irrational numbers; the pulverizer and “Pell’s equation” (these two were drawn upon for the corresponding section in the GK); various kinds of linear and quadratic equations with one or more unknowns (the text is not extant beyond the beginning of the section on linear equations); and equations involving the product of different unknowns. Thus it is modeled directly on the BG.

Sometime after Bhāskara one Devarāja⁵⁵ composed a Kuṭṭākāraśiromaṇi,⁵⁶ on which he wrote his own *ṭīkā*, entitled Mahālakṣmīmuktāvalī. His objective was to expand upon the pulverizer as propounded by Āryabhaṭa. Also subsequent to Bhāskara Rāmacandra wrote a Kautukalīlāvatī.⁵⁷ In this work, after the *paribhāṣā*, come problems of plane and solid geometry and estimates of the quantities of various substances in differently shaped containers; involved are, among other things, specific gravities. Traditional mathematics was continued in the sixteenth century by the Bijādhyāya of Jñānarāja, who wrote the SSJ in 1503 and was the father of Sūryadāsa, the commentator on Bhāskara’s L and BG; and by the Gaṇitamañjarī of Jñānarāja’s great nephew, Gaṇeśa.⁵⁸ Neither of these works has been published.

Except for commentaries, no significant traditional Sanskrit works on mathematics were written after the sixteenth century. At Jayasiṃha’s court at Jayapura, however, in the 1720’s and 1730’s, an effort was made to translate Arabic and Persian versions of Greek mathematical treatises into Sanskrit. The two leading translators were Nayanasukhopādhyāya⁵⁹ and Jagannātha; the former translated, at the dictation of Muḥammad Ābida, the Σαριρική of

Mathematics in astronomy

The mathematics utilized in astronomical texts is most developed in the areas of analemmata and of trigonometry—as well as, of course, the application of the pulverizer to astronomical problems that we have already considered. Some of the most significant mathematical work undertaken in India was in connection with trigonometry.⁶¹ Briefly, after the initial success in constructing tables of Sines and Versines and in inventing a rule for finding the approximate Sine of any angle in the fifth through seventh centuries, the next advance was the discovery by the second Bhāskara of the formula for the addition of Sines. The more advanced trigonometry of the seventeenth and eighteenth century astronomers of northern India seems to be due to the influence of al-Kāshī and Ulugh Beg.

But in Kerala truly extraordinary advances were made by a school of astronomer-mathematicians building on the pioneering work of Mādhava of Saṅgamagrāma in the late fourteenth and early fifteenth century. He evidently discovered what is called "Gregory's Series" for π and the power series for sines and cosines associated with Newton and Leibniz.⁶² Mādhava's work was

⁶⁰ Edited by H. DHURVA and K. TRIVEDIN as Bombay SS 61–62, 2 vols., Bombay 1901–1902.

⁶¹ See, for example, A. N. SINGH, "Hindu Trigonometry," PBMS, NS 1 (1939), 77–92; and the following articles, among others, by R. C. GUPTA: "Early Indians on Second Order Sine Differences," IJHS 7 (1972), 81–86; "Bhāskara I's Approximation to Sine," IJHS 2 (1967), 121–136; "Addition and Subtraction Theorems for the Sine and the Cosine in Medieval India," IJHS 9 (1974), 164–177; "Sine of Eighteen Degrees in India up to the Eighteenth Century," IJHS 11 (1976), 1–10; and "Sines of Submultiple Arcs as found in the Siddhānta-tattvaviveka," RUMJ 5 (1974), 21–27.

⁶² After the work of C. M. WHISH, "On the Hindú Quadrature of the Circle and the Infinite Series of the Proportion of the Circumference to the Diameter in Four Śāstras, the Tantrasangrahaṃ, Yūcti Bhāṣhā, Carana Paddhati, and Sadratnamālā," TRAS 3 (1830), 509–523, the investigation of this topic was revived by C. T. RAJAGOPAL; see K. M. MARAR and C. T. RAJAGOPAL, "On the Hindu Quadrature of the Circle," JBBRAS, NS 20 (1944), 65–82, and "Gregory's Series in the Mathematical Literature of Kerala," MS 13 (1945), 92–98; C. T. RAJAGOPAL and A. CHAPTER IV

DIVINATION

Omens (*adbhuta*, *utpāta*, *nimitta*) have probably always been regarded by Indians, as by others, as a means of knowing the future. There are, for instance, various references in the Ṛgveda (II 42—43 and X 165) and in the Atharvaveda (VI 27—29 and VII 64) to an ominous bird (*śakuna*). But the earliest attempts¹ to list and classify omens and to provide their ritual countermeasures (*śānti*) occur in the Kauśikasūtra² (XIII = *kaṇḍikās* 93—136) of the Atharvaveda and the common source³ of the Adbhutabrāhmaṇa, which is adhyāya VI or V of the Ṣaḍviṃśabrāhmaṇa,⁴ the Āśvalāyanagṛhyapariśiṣṭa⁵ (IV 11—22), and the Adbhutaśānti⁶ of the Atharvavedapariśiṣṭa. The omens in this latter source were associated with the seven deities Indra, Varuṇa, Yama, Agni, Vaiśravaṇa, Viṣṇu, and Vāyu, and involve phenomena occurring on the earth, in the atmosphere, and in the heavens. One cannot but be struck by the similarity of these omens with their *śānti* rituals to the Babylonian omens with their *namburbi* rituals, though no exact parallels exist since the Indian omens are without apodoses. It is possible, however, though not demonstrable, that the original of these three Sanskrit texts was at least in part dependent on a Mesopotamian prototype that reached India slightly before or after the Achaemenid occupation of Gandhāra in the sixth century B.C.⁷

Much clearer is the transmission of Mesopotamian omen texts—both protases and apodoses—to India in the fifth and fourth centuries B.C., for the contemporary Sanskrit and Prakrit literature is replete with references to and

⁷ D. PINGREE, "Mesopotamian Astronomy and Astral Omens in Other Civilizations," Rencontre Assyriologique.

examples of such omens.⁸ They are related mainly to two cuneiform series: *Šumma ālu*,⁹ which deals with terrestrial omens affecting individuals, and *Enūma Anu Enlil*,¹⁰ which deals with atmospheric and celestial omens affecting countries or their rulers. The Buddha was represented in the *Dighanikāya* (I 1, 24) as condemning the Brāhmaṇas who earn their living from the useless knowledge of omens, but, in a later Buddhist story, the *Śārdūlakarṇāvadāna*,¹¹ written probably in the first century A.D., the display by an outcaste of a knowledge of astral omens similar to those of *Enūma Anu Enlil* and of the mathematical astronomy adapted from Babylonia by Lagadha is used to establish the outcaste's equality with a Brāhmaṇa. The earliest version of this *avadāna* includes sections on the characteristics of the native born when the Moon is in each *nakṣatra* (61–62); the character and/or fate of an individual or people if a city is entered when the Moon is in each *nakṣatra* (pp. 62–67; in verse); a list of the countries and regions of India dominated by each *nakṣatra* (pp. 67–68); the affect on the country if the first rainfall in the last month of *grīṣma* (summer) occurs as the Moon is in each *nakṣatra* (pp. 68–79); what a lunar eclipse in each *nakṣatra* portends (pp. 79–81); actions to be accomplished when the Moon is in each *nakṣatra* (pp. 81–98; in verse); a similar description of actions to be undertaken when the Moon is in one of seven categories of *nakṣatras*¹² (pp. 98–99; mixed prose and verse); prognostications from the *nakṣatra* occupied by the Moon on the occasion of an earthquake and from other phenomena associated with earthquakes (pp. 108–123; in verse); the course of a disease that begins when the Moon is in each *nakṣatra* (pp. 123–128; in verse); in how long a period of time a prisoner will be released if he is bound when the Moon is in each *nakṣatra* (pp. 128–129); and the fate of a woman depending on the part of her body that bears a *tilaka* (pp. 129–132; in verse). All of this material was translated into Chinese by Chu Lüh-yen and Che K'ien in the Kingdom of Wu in about 250, and most of it by Dharmarakṣa at Lo-yan in about 300.¹³ Before the *Śārdūlakarṇāvadāna* had been translated into Tibetan by Ajitaśribhadra and Śākyaprabha in about 864 there had been

⁸ Many references to omens and their *śāntis* in the literature of this and later periods are collected by P. V. KANE, *History of Dharmaśāstra*, vol. 5, pt. 2, Poona 1962, pp. 719–814.

⁹ The most recent treatment is the thesis by S. M. MOREN, *The Omen Series Šumma Alu: A Preliminary Investigation*, University of Pennsylvania 1978.

¹⁰ E. F. WEIDNER, "Die astrologische Serie Enūma Anu Enlil," *AfO* 14 (1941/44), 172–195 and 308–318; 17 (1954/56), 71–89; and 22 (1968/69), 65–75. See also the new edition of the stellar omens being prepared by E. REINER and D. PINGREE, *Babylonian Planetary Omens*, of which two fascicles have appeared (Malibu 1975 and 1981).

¹¹ Edited by S. MUKHOPADHYAYA, Santiniketan 1954.

¹² As it stands the text discusses only the categories *dhruva* (fixed), *kṣipra* (swift), and *dāruṇa* (sharp); the rest can be supplied from such texts as the *Parāśaratantra* (see D. PINGREE in *Viator* 7 (1976), 175).

¹³ The translation into Chinese made by An Shi-kāo in about 150 contains only a brief summary of the story without the elaborate astronomical and omen sections.

added to it a second chapter on the native born as the Moon is in each *nakṣatra* (*nakṣatrajanmaguṇa*) (pp. 132–135; in verse). At an even later date the Sanskrit text was expanded by the addition of a number of chapters on omens, most of which are in verse. Their subjects include *utpātas*—primarily celestial or atmospheric phenomena affecting or associated with the Sun or the Moon in specific *nakṣatras* and/or months or *pakṣas* (pp. 136–147); birth-marks (*pinya?*) resulting from the *nakṣatra* occupied by the Moon at the time of the native's birth (pp. 147–151); boils or pimples (*piṭaka*) as omens (pp. 151–154); two chapters on oneiromancy (pp. 154–164); astral and atmospheric omens in each month (pp. 164–166; in prose); omens from the wagtail (*khañjarīṭaka*) (pp. 166–167); from the howling of the jackal (*śivāruta*) (pp. 167–171; in prose); palmistry (*pāñilekhā*) (pp. 172–175); omens from the cawing of crows (*vāyasaruta*) (pp. 175–180); omens from the shape and appearance of a house (*dvāralakṣaṇa*) (pp. 180–182); determining the thought of the client from his touching by chance one of twelve circles drawn by the astrologer (pp. 183–187); the qualities of a maiden having various physical features (*kanyālakṣaṇa*) (pp. 187–191); garments as the Moon is in each *nakṣatra* (p. 192); the omens used for agriculture (pp. 193–197); supernatural beings (pp. 197–200; very corrupt); omens from smoke (*dhūmika*) (p. 201); and actions to be undertaken on each *tithi* of a *pakṣa* (*tithikarma*) (pp. 201–203). Thus, to the original contents of the omen sections of the text, which depend almost exclusively on the *nakṣatra* occupied by the Moon, have been appended the most heterogeneous material relating to dreams, physiognomy, the cries of animals and birds, and so on. All of these forms of omens, of course, occur in other texts.

The earliest extant such text is the first version of the *Gargasamhitā*,¹⁴ a work probably written in the first century B.C. or A.D. and taking the form of a dialogue between Krauṣṭuki (Rṣiputra) and Garga. This vast, unpublished text originally contained some sixty-two *aṅgas*. The first three utilize the Moon and the *nakṣatras*, and are related to the omens of the original Śārdūlakarṇāvadāna; *karmaguṇa* (on actions undertaken at specified times), *candramāna*, and *nakṣatrakendrabha*. The next nine (*aṅgas* 4–12) deal with the motion of celestial bodies—the Moon's node (Rāhu), Jupiter, Venus, comets (Ketu), Saturn, Mars, Mercury, the Sun, and Canopus (Agastya). There follow four (*aṅgas* 13–16) on the circles (*cakra*) of intermediate directions (*antara*), deer (*mṛga*), dogs (*śvā*), and winds (*vāta*). Then come three (*aṅgas* 17–19) sciences (*vidyā*)—of houses (*vāstu*), of limbs (*aṅga*), and of crows (*vāyasa*)—and three (*aṅgas* 20–22) conjunctions of the Moon with the *nakṣatras* Svāti, Āśāḍha, and Rohiṇī. *Aṅga* 23 lists the countries dominated by each *nakṣatra*, and *aṅga* 24 gives prognostications involving rainfall. The following seven (*aṅgas* 25–31) are devoted to the planets—the things they influence (*kośa*), their conjunctions

¹⁴ CESS A2, 116a–117b; A3, 29b; and A4. I am also deeply indebted to JOHN MITCHNER for his full account of the contents of the *Gargasamhitā* and of some of its imitators.

(*samāgama*), their *amrādakṣiṇya* (is this *abhrādarśana*, “obscuration by clouds”?), their conflicts (*yuddha*), their configurations beginning with the “triangle” *yoga* (*śrṅgātaka*), their “traditions” (*purāṇa*), and the ripening (*pāka*) of their effects. Then come three (*aṅgas* 32–34) on military omens; they are expeditions (*yātrā*), fire omens (*agni*), and the array of the army (*senāvyūha*). The next two (*aṅgas* 35 and 36) are entitled “variegation of the peacock” (*mayūracitra*) and “lotus of the world” (*bhuvanapuṣkara*). There follow two (*aṅgas* 37 and 38) on rituals: the offering of oblations (*balyupahāra*) and the performance of *śānti* rites. *Aṅga* 39 is a collection of various omens (*utpāta*) portending disaster to countries; and *aṅga* 40 is entitled “the treasure on the scales” (*tulākośa*). *Aṅga* 41 is the well known historical prophecy, the *Yugapurāṇa*.¹⁵ In *aṅga* 42 are collected omens based on the cries (*ruta*) of various birds and animals: crows (*vāyasa*), woodpeckers (*śatapattrā*), bluejays (*cāṣa*), cranes (*sārasa*), *pesamas* or *pesamās* (?), cows (*śakkarikā*), peacocks (*mayūra*), *visphoṭis* (?), *ciriṇi*-crows, skylarks (*bhāradvāja*), doves (*kapoti*), cuckoos (*kokila*), vultures (*śakuni*), owls (*ulūka*), *piṅgalā*-owls, peahens (*nartakā*), *sundarikās* (?), partridges (*tittiri*), cats (*biḍāla*), hares (*śasaka*), asses (*gardabha*), vixens (*lomaśā*), bulls (*vṛṣabha*), *lopā*-birds, and spotted antelopes (*prṣata*). There follows a section (*aṅga* 43) on tears in garments. The next (*aṅga* 44) is entitled “the tradition (*purāṇa*) of Bṛhaspati (or of Jupiter).” *Aṅga* 45 presents omens involving “Indra’s banner” (*indradvaja*). The next five (*aṅgas* 46–50) employ as omens the characteristics of several kinds of animals—rams, tortoises, women, elephants, and cows. *Aṅga* 51 is entitled “the appearance (*saṁsthāna*) of Venus.” There follows a section (*aṅga* 52) on the “pregnancy” (*garbha*) of the clouds before the beginning of the rainy season, and then comes one (*aṅga* 53) on water divining (*dakārgala*). The next group of five chapters (*aṅgas* 54–58) deals with “atmospheric” phenomena: violent storms (*nirghāta*), earthquakes (*bhūmikampa*), halos (*pariveśa*) around the Sun and the Moon, meteors (*ulkā*), and halos again. *Aṅga* 59 is on the nature of the seasons (*ṛtusvabhāva*), but the next (*aṅga* 60) is devoted to omens occurring at dawn or evening (*sandhyā*). *Aṅga* 61 is a second chapter on meteors. And finally, *aṅga* 62 describes the *nakṣatra* melothesia of the celestial *puruṣa*. A *mayūracitraka* on various *utpātas* is appended to the text.

This vast panoply of omens, a very large number of which can be paralleled in cuneiform texts, has been extraordinarily influential on Indian life and

¹⁵ See K. P. JAYASWAL, “Historical Data in the Garga-Saṁhitā and the Brahmin Empire,” JBORS 14 (1928), 397–421, and “The Paris Manuscript of the Garga Saṁhitā,” JBORS 15 (1929), 129–133; K. H. NARAIN, *The Indo-Greeks*, Oxford 1957, pp. 174–179; and D. C. SIRCAR, “The Account of the Yavanas in the Yuga-Purāṇa,” JRAS (1963), 7–20; “The Yavanas and Mathurā,” JAIH 6 (1972–73), 168–173; and “Problems of the Yugapurāṇa,” in his *Studies in the Yugapurāṇa and Other Texts*, Delhi 1974, pp. 1–16. A new edition by J. MITCHNER should appear shortly.

literature. Parts have been used by the authors of the Mahābhārata and of some of the *purāṇas*; and omens in general have become as important an aspect of life in India as they were in Mesopotamia. The technical texts on divination (usually entitled *saṃhitā*) are to a large extent dependent on the Gargasamhitā; of these the most important is the Bṛhatsamhitā of Varāhamihira, which will be described below. It was also used with other texts by the composer of several of the Pāṇisṣṭas of the Atharvaveda; these are: L on lunar omens (*candraprātipadika*; cf. GS 2–3), LI on planetary conflicts (*grahayuddha*; cf. GS 28), LII on planetary conjunctions (*grahasamgraha*; cf. GS 26), LIII on the motion of the Moon's node (*rāhucāra*; cf. GS 4), LIV on the motion of comets (*ketucāra*; ascribed to Bhārgava, but cf. GS 7), LV on seasonal comets (*ṛtuketulakṣaṇa*), LVI on the distribution of the countries on the back of the "tortoise" earth among the *nakṣatras* (*kūrmavibhāga*; cf. GS 23), LVII on the "circles" among the *nakṣatras* of Agni, Vāyu, Varuṇa, and Mahendra (*maṇḍalāni*), LVIII on the "burning of the directions" (*digdāha*), LVIII b on meteors and falling stars (*ulkā*; cf. GS 57 and 61), LIX on lightning (*vidyut*), LX on violent storms (*nirghāta*; cf. GS 54), LXI on omens occurring at dawn or evening (*<sandhyā>*; cf. GS 60), LXII on earthquakes (*bhūmikampa*; cf. GS 55), LXIII on halos (*<pariveśa>*; cf. GS 56 and 58), LXIV on *utpātas* (cf. GS 39), LXV on sudden rainstorms (*sadyovṛṣṭi*), and LXVIII on oneiromancy (*svapna*).

There are several other works entitled Gargasamhitā, ¹ at of these only one—the second GS¹⁶—deals with omens. It belongs to a class of *saṃhitās* attributed to ṛṣis that lie intermediate between oromen texts and texts on *mukūrtaśāstra*. They will be described in a later section.

Several of the works associated with Garga contain sections on meteorological predictions, and particularly on the prediction of the rains. A separate work on that subject attributed to Garga, the Meghamālā,¹⁷ has also been preserved. The phenomena utilized include winds, clouds, mock Suns (*pratisūrya*), halos, violent storms, and eclipses. Another Meghamālā is ascribed to Śiva. To Garga is also attributed a work on a form of divination also known in Mesopotamia, that from falling lizards. It bears several titles, all variations on Pallisaraṭapatanavidhāna.¹⁸ Similar texts are ascribed to other ṛṣis such as Śaunaka.

In the early fourth century Garga was named as an authority on omens along with Parāśara¹⁹ by Mīnarāja in his Vṛddhayavanajātaka (67, 5). This Parāśara is undoubtedly the one cited by Varāhamihira concerning the motion of Mercury (BS 7, 8); as an authority on comets along with Garga, Asita,²⁰ and

Devala²¹ (BS 11, 1); concerning planetary conflicts (BS 17, 3); as an authority, together with Garga, Kāśyapa,²² and Vajra, on the “pregnancy” of clouds (BS 21, 2); as agreeing with Garga and Vasiṣṭha on the extent of the area on which a predicted rain will fall (BS 23, 4); as one of the experts, along with Bṛhaspati,²³ Garga, Kāśyapa, and Maya²⁴ on the Moon’s conjunction with Rohiṇī (BS 24, 2); and as addressing his discussion of the characteristics of cows to Bṛhadratha (BS 60, 1). The work of Parāśara on omens is probably the lost prose and verse Parāśaratantra cited frequently by Bhaṭṭotpala in his commentary on the BS. The omen section of Mīnarāja’s VYJ comprises *adhyāyas* 64–71, which are respectively on signs of death, on counter-omens to evil portents, on oneiromancy, on various omens, on the cawing of crows, on the cuckoo laying eggs (*śyāmāceṣṭita*), on the activities of dogs (*śvāceṣṭita*), and on the activities of cows (*goceṣṭita*). Other early authorities on omens mentioned by Varāhamihira, and therefore antedating the middle of the sixth century, include²⁵ Atri²⁶ on *utpātas*, which was used by Garga (BS 45, 1); Ṛṣabha,²⁷ who summarized the views of Śakra (Indra²⁸), Śukra (Bṛghu), Vāgīśa (Bṛhaspati), Kapiṣṭhala,²⁹ Garutmān,³⁰ Bhāguri,³¹ and Devala on *śakuna* (BS 85, 1); the Mahārājādhirāja of Avanti, Dravyavardhana,³² who was an authority on *śakuna* (he was probably an Aulikara monarch ruling in about 500) (BS 85, 2); Nārada on comets (BS 11, 5) and as Bṛhaspati’s student regarding the Moon’s conjunction with Rohiṇī (BS 24, 2) (this Nārada is different from the author of the currently available Nāradasaṃhitā, but Varāhamihira may have in mind Nārada’s Mayūracitraka); Bādarāyaṇa³³ on the ripening of grain (BS 39, 1); Bṛghu³⁴ on *śakuna* (BS 85, 43); Manu³⁵ on water divining (BS 53, 99); and Sārasvata, also on water-divining (BS 53, 99).

The Bṛhatsaṃhitā³⁶ itself is the classical work on *saṃhitā*. It is divided in

³⁶ Edited by H. KERN as BI 48, Calcutta 1865; published with a Marāṭhī translation, Ratnāgiri 1873; edited with his own Hindi *īkā* by B. PRABHU, Benares 1880; edited by JIVĀNANDA VIDYĀSĀGARA, Calcutta 1880; edited by PAÑCĀNANA TARKARATNA, Calcutta 1882; edited with his own Hindī translation by DURGĀ-

different editions into 106 or 107 *adhyāyas*,³⁷ which cover most of the topics of the GS.³⁸ The remaining topics include: the moral, physical, and intellectual attributes of an astrologer (BS 2; cf. YJ 51, 12–20); the motion of Ursa Maior (Saptarṣis) (BS 13); the characteristics of the years belonging to each of the planets (BS 19; see YJ 78, 11–17); on sudden rainstorms (BS 28); on flowers and creepers (BS 29); on the “burning of the directions” (BS 31; see Paṛiśiṣṭa LVIII); on rainbows (*indrāyudha*; BS 35); on the Gandharva cities formed by clouds (BS 36); on mock Suns (BS 37); on the ripening of grain (BS 39); on the objects associated with each zodiacal sign (BS 40; see YJ 4); on the fluctuation of prices (*arghakāṇḍa*; BS 41); on the lustration of arms (*nīrājana*; BS 43); on wagtails (BS 44; see Śārdūlakarṇāvadāna, pp. 166–167); on the Puṣya ablution (BS 47); on honorary turbans (*paṭṭa*; BS 48); on swords (*khaḍga*; BS 49); on boils or pimples (BS 51; see Śārdūlakarṇāvadāna, pp. 151–154); on arbori-

PRASĀDA, Lucknow 1884; published with a Bengālī translation in Aruṇodaya 1 (1890), no. 4; edited with Utpala’s *virṭi* by SUDHĀKARA DVIVEDIN as VSS 10, 2 vols., Benares 1895–1897, reprinted by A. TRIPĀṬHĪ as SBG 97, 2 vols., Vārāṇasī 1968; edited with his own Hindī translation by BALADEVAPRASĀDA MIŚRA, Bombay 1897, reprinted Bombay 1918, Bombay 1952, and Bombay 1955; edited with the Bengālī translation of DHĪRĀNANDA KĀVYANIDHI by PAÑCĀNANA TARKARATNA, 2nd ed., Calcutta 1910; edited with an English translation by V. SUBRAHMANYA SASTRI and M. R. BHAT, 2 vols., Bangalore 1947; and edited with his own Hindī *īkā* by ACYUTĀNANDA JHĀ as VSG 41, Vārāṇasī 1959. The beginning of an edition with a Kannaḍa translation appeared in Ātmānanda (1910), pts. 1–4. *Adhyāya* 53, on water divination, was edited with a Marāṭhī translation by V. N. GORE, Bombay 1911. There are English translations by H. KERN, “The Bṛhat-Saṁhitā; or, Complete System of Natural Astrology of Varāhamihira. Translated from Sanskrit into English,” JRAS (1870), 430–479; (1871), 45–90 and 231–288; (1873), 36–91 and 279–338; and (1875), 81–134, reprinted in his *Verspreide Geschriften*, 16 vols., ’s-Gravenhage 1913–1929, vol. 1, pp. 169–319, and vol. 2, pp. 1–154; and by N. CHIDAMBARAM IYER, 3 vols., Madura 1884–1885.

³⁷ Utpala’s version, to which I here refer, omits the other editions’ *adhyāya* 38 (*rajalakṣaṇa*; on haze); it is also omitted from Varāhamihira’s own list of *adhyāyas* (BS 106, 5).

culture (*vrkṣāyurveda*; BS 54); on temples (*prasāda*; BS 55); on adamantine glue (*vajralepa*; BS 56); on images (*pratimā*; BS 57); on entering the forest to find the appropriate trees for making images (BS 58); on installing the images (BS 59); on dogs (BS 61; see VYJ 70); on cocks (*kukkuṭa*; BS 62); on goats (*chāga*; BS 64); on horses (*aśva*; BS 65); on men (*puruṣa*; BS 67); on the five *mahāpuruṣas* (BS 68); on fly-whisks (*cāmara*; BS 71); on umbrellas (*chatra*; BS 72); in praise of women (*strīpraśamsā*; BS 73); on causing affection (*saubhāgyakaraṇa*; BS 74); on aphrodisiacs (*kāṇḍarpika*; BS 75); on perfumes (*gandhayukti*; BS 76); on the union of women and men (BS 77); on beds and seats (*śayyāsana*; BS 78); the examination of jewels³⁹ (*ratnaparīkṣā*; BS 79); on pearls (*muktā*; BS 80); on rubies (*padmarāga*; BS 81); on emeralds (*marakata*; BS 82); on lamps (*dīpa*; BS 83); on sticks for cleaning the teeth (*dantakūṣṭha*; BS 84); animal and bird omens (*śākuna*; BS 85); on the howling of the jackal (BS 89; see Śārdūlakarṇāvadāna, pp. 167–171); on the activities of animals (*mrgaceṣṭita*; BS 90); on the movements of cows (BS 91; see VYJ 71); on the movements of horses (*aśveṅgita*; BS 92); on the activities of elephants (BS 93); further animal and bird omens (BS 95); on natives born when the Moon is in each *nakṣatra* (BS 100; see Śārdūlakarṇāvadāna, pp. 61–62 and 132–135); the correspondence of zodiacal signs to *nakṣatras* (BS 101); on the horoscope of the wedding⁴⁰ (*vivāhapaṭala*; BS 102); on the planets' transits of the astrological places in the base-nativities (*grahagocara*, a topic appropriate to genethialogy rather than divination; BS 103; see YJ 43). The wealth of information on the material, social, and religious life of India both in Varāhamihira's own time and in earlier periods (the latter can be assessed only by comparing the BS with the GS and their Babylonian sources) contained in the BS is obviously enormous.⁴¹

The popularity of the BS was great, though the vastness of the text precluded much commentarial work. The chief effort in that direction that we possess is the extremely valuable *vivṛti* completed by Bhaṭṭotpala in Kāśmīra in 967; based on Bhaṭṭotpala's work is the *Utpalaparimala* composed by Bhāskarārya Yogin⁴² at Śrīraṅga on the Kāverī in 1235. The BS with Bhaṭṭotpala's *vivṛti* was read by al-Bīrūnī in the Panjāb in preparation for writing his *India* in 1030/1031. It was translated into Persian by 'Abd al-'Azīz Dihlawī⁴³ for Fīrūz Shāh Tughlūq in about 1375; *adhyāyas* 66 and 68 were translated into Tamil anonymously;⁴⁴

³⁹ *Adhyāyas* 79–82 are edited with a French translation by L. FINOT, *Les lapidaires indiens*, Paris 1896, pp. 59–75.

⁴⁰ Utpala claims that this *adhyāya* is based on the work of an otherwise unknown Vindhyaśāsin. See below for Varāhamihira's independent treatise entitled *Vivāhapaṭala*.

⁴¹ Not entirely satisfactory is A. M. SHASTRI, *India as Seen in the Brhatsaṃhitā of Varāhamihira*, Delhi—Patna—Varanasi 1969.

and there seems to exist a paraphrase in Sinhalese.⁴⁵ Varāhamihira himself wrote an abridgement, the *Samāsasaṃhitā*,⁴⁶ of which only quotations, notably in Bhaṭṭotpala's *virtti* on the BS, now survive.

Probably not far in time from Varāhamihira an unnamed Jaina composed an immense work in Prakrit on omens entitled *Aṅgavijjā*,⁴⁷ which classifies every perceptible object in the world as a ominous entity. It remains an inadequately explored treasure of the material aspects of Indian culture. Another Jaina, claiming to be Bhadrabāhu,⁴⁸ the last *śrutakevalin*, composed on mainly celestial omens a *Bhadrabāhusaṃhitā* or *Nimitta*⁴⁹ in the period between the BS, on which much of the work is based,⁵⁰ and Bhaṭṭotpala, who cites BBS 15, 92–95, on BS 9, 37. The subjects not directly corresponding to Varāhamihira's that Bhadrabāhu takes up are lightning (BBS 5; cf. *Parīṣiṣṭa* LIX); clouds (BBS 6 and 8; cf. second GS 14); military expeditions (BBS 13; cf. GS 32); planetary omens (BBS 25); and oneiromancy (BBS 26; cf. VYJ 66). A third Jaina text (though some manuscripts make it Śaiva) written in this period is by Garga,⁵¹ who is usually identified with the *guru* named by Siddharṣi in 905; this is variously titled *Pāśakevalī*,⁵² *Marutajñānapraśna*, etc. It is an elaborate treatise on divination by means of dice, giving the interpretation of each of the combinations of three of the numbers 1, 2, 3, and 4, in all possible orders.

15 (Venus' motions)	9	24 (planetary conflicts)	17

⁵¹ CESS A2, 122b–126a; A3, 30b–31a; and A4.

⁵² Edited by A. WEBER, "Über ein indisches Würfel-Orakel," *MPAWB* (1859), 158–180; see also his *Indische Streifen*, vol. 1, Berlin 1868, pp. 274–307; published at Kāśī in 1884; published with a Telugu translation, Madras 1890; edited by A. F. R. HOERNLE, *The Bower Manuscript*, Calcutta 1893, pp. 203–221; and edited by J. E. SCHRÖTER, Borna 1900.

Though Bhaṭṭotpala quotes from both Nārada (on BS 11, 5) and Vasiṣṭha (on BS 5, 3; 32, 2; and 57, 8) in his *viṛti* on the BS, none of these citations occurs in the currently available Nāradasaṃhitā and Vasiṣṭhasaṃhitā; the relation of his citations of verses of Brhaspati (on BS 35, 3; 52, 2–3; and 52, 87–88) to the extant Brhaspatisaṃhitā⁵³ cannot as yet be determined. Other authorities on omens whom Bhaṭṭotpala was able to quote in 967 include Nandin,⁵⁴ Bhānubhaṭṭa,⁵⁵ and Śālihotra, as well as the authority, Samudra, after whom the science of physiognomy was later named *sāmudrika* (on BS 67 and 69).

Al-Bīrūnī, in his India (14), lists the names of seven authors of *saṃhitās*: Māṇḍavya,⁵⁶ Parāśara, Garga, Brahman,⁵⁷ Balabhadra, Divyatattva,⁵⁸ and Varāhamihira. Of these authors, Balabhadra and Divyatattva are not known from Sanskrit sources to have composed *saṃhitās*, though there is an Adbhutataraṅgiṇī on omens by a Balabhadra.⁵⁹

Vasantarāja composed his Śakunārṇava⁶⁰ at or near Vārāṇasī in the 1090's since he dedicated it to the Gāhaḍavāla Candradeva (ca. 1089–ca. 1103). In a verse toward the beginning (1, 27) he names as his predecessors Atri, Garga, Guru (Brhaspati), Śukra (Bṛgu), Vasiṣṭha, Vyāsa, Kautsa (perhaps Aṅgiras⁶¹), Bṛgu, and Gautama.⁶² Its twenty *vargas* give omens from the cries and movements of birds and animals. A *ṭikā* was written by Bhānucandra Gaṇi⁶³ of the Tapāgaccha in about 1559 in the empire of Akbar (1556–1605); it was edited by Bhānucandra's pupil, Siddhicandra.

In about 1160 Durlabharāja,⁶⁴ a scion of the Prāgvāṭa family of Gujarāt who was made a *mahattara* by the Caulukya Kumārapāla (ca. 1143–1152), began a Sāmudrikatilaka⁶⁵ that was finished by his son, Jagaddeva.⁶⁶ This is the earliest complete Sanskrit text on physiognomy and palmistry that we possess, though we have seen that the subject was earlier treated in the Śārdūlakarṇāvadāna (pp. 129–132, 147–154, 172–175, and 187–191), the GS (18 and 48), the BS (50, 51, 67, and 69), and other texts. Durlabharāja adds

(in 1, 9) to the authors whose names we have already encountered Lakṣaka and Sumanta, of whom nothing further is known, and the famous Paramāra Bhojarāja of Dhārā, whose work on *sāmudrika* has not survived.

Durlabharāja's son, Jagaddeva, besides completing his father's *Sāmudrikatilaka*, wrote an important treatise on oneiromancy, the *Svapnacintāmaṇi*,⁶⁷ in about 1175. Again, though this is the earliest independent treatise on *svapna* that we possess, the interpretation of dreams goes back in Sanskrit literature to the *R̥gveda*,⁶⁸ and had been treated systematically since at least the time of Mīnarāja (VYJ 66).⁶⁹ Aside from some oneiromancies preserved in various *purāṇas*—e.g., *Matsyapurāṇa* 241 and *Brahmavaivartapurāṇa*, Kṛṣṇajñanma-khaṇḍa 77 and 82—the most common Sanskrit text on the interpretation of dreams is the *Svapnādhyāya* attributed to Bṛhaspati.⁷⁰

Contemporary with Durlabharāja and Jagaddeva was Narapati,⁷¹ who completed his *Narapatijayacaryā* or *Svarodaya*⁷² at Anāhilanagara in Saurāṣṭra in 1177. This work describes various arrangements (*cakras*) of letters associated with time divisions and astrological entities, magical pictures of animals and objects (also called *cakras*), and arrangements of *nakṣatras*, months, and numbers relative to the directions (*bhūmis*), all of which promote the military victory of their user. Narapati names as his sources (1, 4–10) seven *yāmala*s (of Brahma, Viṣṇu, Rudra, Ādi, Skanda, Kūrma, and Devī), the *Yuddhajayārṇava*, the *Svarabhairava*, the *Raṇābhavayatantra*, the *Jayapaddhati*, and various other tantric texts. The NJ was commented on by Narahari⁷³ during the reign of Bhairavendra, who ruled Mithilā from ca. 1480 till ca. 1515 (*Vyākhyāplava*), and by Harivaṃśa Pāṭhaka in ca. 1500 (*Jayalakṣmī*); the latter was revised by Harivaṃśa's son, Mahādeva,⁷⁴ in 1520. Based on the NJ is the *Balatantrama-*

⁶⁷ Published with a Marāṭhī translation, Bombay 1848; edited with a Marāṭhī *ṭīkā* by J. H. ĀṬHALYE, Ratnāgiri 1873; edited with a Telugu version by ŚEṢĀCALA ŚĀSTRĪ, Madras 1911; and edited with a German translation by J. VON NEGELEIN, Giessen 1912.

⁶⁸ See, for example, the references given by TSUJI in ABORI 48–49 (1968), 177 fn. 5, and in VON NEGELEIN's edition of Jagaddeva, p. 378.

⁶⁹ Predictions of the substance of dreams on the basis of the zodiacal signs and planets are given by *Sphujidhvaja* (YJ 69–70). hārṇava of Ādityadeva,⁷⁵ on which a *ṭikā* in Telugu was written by Daivajña-dāsa,⁷⁶ and the Sāroddhāra composed by Śraddhā Ṛṣi in about 1837.

Contemporaneously with the three authors from Saurāṣṭra the Mahārājā-dhirāja of Bengal from ca. 1159 till 1178, Ballālasena,⁷⁷ began his Adbhutasāgara⁷⁸ in 1168; it was completed by his son and successor, Lakṣmaṇasena, who ruled Bengal from ca. 1178 till 1200. It deals with most of the celestial, atmospheric, and terrestrial omens in a comprehensive fashion, and is the next most popular text in this field after the BS. A similar text, which is probably at least in part dependent on Ballālasena's, is the Adbhutadarpaṇa of Mādhava.⁷⁹

Treatments of omens in the thirteenth century were rare except among the Jainas of Gujarāt and Rājasthān. There are scattered references in the Trailokyaprakāśa written by Hemaprabha Sūri probably in 1248, a work which will be discussed more fully below. And in 1281 Māṇikya Sūri⁸⁰ composed a Śakunasāroddhāra. A Hindu, Lāvaṇyaśarmaṇ, was the author of a Śakunapradīpa;⁸¹ he himself copied a manuscript of it at Vijāpura in 1344.⁸² In some manuscripts of the gigantic Jyotiribandha composed by Śivarāja between ca. 1475 and 1500 there is inserted a *cārādhya*,⁸³ this is based almost entirely on Varāhamihira's BS (3–13, 17–18, and 20) with a few quotations from the *saṃhitās* of Kāśyapa, Nārada, and Vasiṣṭha.

Slightly before Śivarāja, in about 1450, Rāmacandra wrote at Naimiṣa in Uttarapradeśa a Samarasāra⁸⁴ similar in intent and contents to Narapati's NJ. There are commentaries composed by Rāmacandra himself together with his brother, Bharata⁸⁵ (Saralā), by Dāmodara⁸⁶ (Saṅketamañjari), and by Dikṣita Sāṃvatsara.⁸⁷ Other works on *svaraśāstra* include the Yuddhajayotsava of Gaṅgārāma⁸⁸ and the Pavanavijaya or Svarodaya attributed to Śiva. Other *cakras* are used in interpreting nativities by Prajāpatidāsa,⁸⁹ who wrote his Pañcasvarānirṇaya or Granthasaṅgraha⁹⁰ before 1625 (the earliest manuscript

was copied in 1631). There are commentaries by Prajāpatidāsa himself as well as by Appaya Dīkṣita⁹¹ and Gauḍa Bhaṭṭācārya.⁹² To Mahādeva⁹³ is ascribed a Pañcapakṣīśakuna⁹⁴ employing the five European vowels for divination; the oldest dated manuscript containing this work was copied in 1750. A related text is the Tattvārthacintāmaṇi⁹⁵ composed together with a *vr̥tti* by Bālakṛṣṇa Vedavṛkṣa⁹⁶ at Kāśī in the 1820's.

But a more important author on omens had flourished a century and a half earlier. The Jaina scholar Meghaviṣaya⁹⁷ wrote a Varṣaprabodha⁹⁸ similar to the Meghamālās of Garga and Śiva in 1675 and a Hastasañjivana⁹⁹ on palmistry in 1680; in this same year he completed a commentary on the latter work. There are, of course, numerous other anonymous works on omens or works attributed to authors of whom nothing is known extant in Sanskrit and vernacular manuscripts. Nothing further can be said of them in the absence of editions and of critical historical studies.

However, one important method of divination that we cannot fail to mention is geomancy (*ramala*, from the Arabic *raml*), which seems to have been introduced into Sanskrit from Persian sources in the early Mughal period. The principal texts on the subject are the Ramalavaicitrya or Ramalabhāskara¹⁰⁰ of Rāma based on the teachings of the Yavanas (Muslims) (the oldest dated manuscript was copied in 1657); the Ramalenduprakāśa composed by Rudra-maṇi Tripāṭhin in 1682; the Ramalarahasya¹⁰¹ written by Bhayabhañjana Śarman¹⁰² in about 1700; the Ramalotkarṣa or Ramalacintāmaṇi of Cintāmaṇi¹⁰³ (the earliest dated manuscript was copied in 1709); the Ramalasāra composed by Śrīpati at Gokula (the oldest dated manuscript was copied in 1718); and the Ramalanavaratna¹⁰⁴ composed by Paramasukha¹⁰⁵ at Kāśī in 1811. Finally,

CHAPTER V

GENETHLIALOLOGY

Jātaka

Though already as a part of divination Indians had for long predicted the characteristics of a native on the basis of the *nakṣatra* occupied by the Moon at his birth (e.g., Śārdūlakarṇāvadāna, pp. 61–62), the prediction of the life of the native on the basis of the horoscope cast at his birth—a science that was developed in Hellenistic Egypt in the second century B.C.—was introduced into India only in the second century A.D. In 149/150, probably at the court of the Western Kṣatrapa Rudradāman in Ujjayinī, a Greek manuscript of an astrological text composed in Egypt shortly after 100 A.D. was translated into Sanskrit prose by the head of the Greek community, who was entitled Yavaneśvara. Already in this translation the Hellenistic system had begun to be Hinduized—for instance, the pictures of the Decans and Hours that adorned the Greek manuscript were interpreted by Yavaneśvara in terms of the iconography of Śiva and Pārvatī.¹ Unfortunately, we no longer have Yavaneśvara's translation, but we do possess a very substantial portion of a versification of it made by the <Yavana>rāja Sphujidhvaja in 269/270, during the reign of the Western Kṣatrapa Rudrasena II. His Yavanajātaka² shows further signs of Hinduization; in particular one suspects that he was responsible for adding the chapter on reincarnation (YJ 43), the lists of minerals, plants, and animals that are influenced by āyurvedic materia medica (YJ 62), and the section on military astrology that is indebted to such sources as the GS (YJ 73–76). The original Greek system was of course further modified so that the predictions fit the social and economic expectations of people born in India, and Indian astrologers after Sphujidhvaja considerably developed genethlialogy by emphasizing some aspects at the expense of others or by creating new and more complex techniques of interpreting horoscopes; but basically all of *jātaka* before the introduction of *tājika* texts in the thirteenth century, and even most of *jātaka* after that, can be traced back to the Yavanajātaka and to the lost work

¹ D. PINGREE, "The Indian Iconography of the Decans and Horūs," JWCJ 26 (1963), 223–254.

² Edited, translated, and commented on by D. PINGREE, The Yavanajātaka of Sphujidhvaja, HOS 48, 2 vols., Cambridge, Mass. 1978.

of Satya, who had access to at least one other Sanskrit translation of a Greek text on genethliology besides the YJ.

Sphujidhvaja's YJ contains seventy-nine *adhyāyas*, which may be divided into five sections: on nativities (YJ 1–51), on *praśna* or interrogations (YJ 52–72), on *yātrā* or military astrology (YJ 73–76), on *muhūrta* or catarchic astrology (YJ 77–78), and on mathematical astronomy (YJ 79). We have already discussed the last section in the chapter on astronomy; here we shall only review the contents of the first, reserving sections two-four for the relevant chapters of this book.

YJ 1 describes the fundamental elements of genethliology—the zodiacal signs (*rāśis*) and their subdivisions (*horās* [ὥρα], *drekāṇas* [δεκαὶνολί], *saptāmśas*, *navāmśas*,³ *dvādaśāmśas* [δωδεκατημόρια], *triṃśāmśas* [τρίαι], *sauras*, *cūdāpadas*, and *līptikas* [λεπτά]); the astrological places (*bhāvas*), categorized as cardines (*kendras*; κέντρα), succedent (*pāṇapharas*; ἐπαναφοραί), and cadents (*āpoklimas*; ἀποκλίματα); the planets' exaltations (*uccas*); their triplicities (*trikoṇas*; τρίγωνα); their aspects (*dṛṣṭi*); the various strengths of the zodiacal signs and planets; and the characteristics, spheres of influence, and interrelationships of the planets. The next two *adhyāyas* (YJ 2–3) describe respectively the figures associated with each of the twenty-four *horās* and thirty-six decans. And *adhyāya* 4 lists the objects associated with the zodiacal signs and the planets. The next two chapters deal with conception and gestation (YJ 5), and the circumstances of birth (YJ 6). In *adhyāya* 7 Sphujidhvaja describes the effects on the natives of the planets being in their exaltations or dejections, in their triplicities, in their own, their friends', or their enemies' houses. *Adhyāyas* 8–9 are devoted to the astrological situations that lead to the birth of kings and other leaders. The four *yogas* of the Moon—*sunaphā* (συναφή), *anapharā* (ἀναφορά), *daurudhara* (δουροφορία), and *kemadruma* (κενοδρομία)—are discussed in *adhyāya* 10, the two of the Sun—*veśi* and *vāśi* (φάσις) in *adhyāya* 11. There follow seven chapters (YJ 12–18) on the native born when each of the planets (in the order Sun, Mercury, Venus, Mars, Jupiter, Saturn and Moon) is in each of the zodiacal signs. *Adhyāya* 19 is on the effect of each of the zodiacal signs in the ascendant, *adhyāya* 20 on that of each of the planets. There follows a section on conjunctions of planets: of two and three planets in YJ 21, of four planets (producing religious natives) in YJ 22, of five planets in YJ 23, and of six and seven planets in YJ 24. The next two chapters (YJ 25–26) enumerate the effects of each of the planets' being in each of the places except the ascendant. In *adhyāya* 27 Sphujidhvaja describes three melothesias: of planets, of *horās*, and of decans. There follow four *adhyāyas* (YJ 28–31) on the native born when each *horā*, decan, *saptāmśa*, and *navāmśa* is in the ascendant. *Adhyāyas* 32 and 33 are on the Moon's and all the other planets' being in each others' *navāmśas*, and *adhyāya* 34 on each of the planets in a *dvādaśāmśa* of each of the zodiacal

³ On the Indian decans and *navāmśas* in Sasanian, Arabic, Byzantine, and Latin astrology see D. PINGREE, *Viator* 7 (1976), 146, 151, 172–173, and 181–184.

signs. In YJ 35 Sphujidhvaja very obscurely deals with the theory of the pro-rogator (ἀφέρτης)—a topic ignored by subsequent Indian astrologers until it was reintroduced as the *hillāja* (Arabic *haylāj*) in *tājika* texts. There is then inserted a chapter (YJ 36) on the planetary configurations known as *yogas*. *Adhyāyas* 37–43 are concerned with the computation of the length of the native's life (*āyurdāya*; YJ 37), with fatal configurations (*ariṣṭayoga*; YJ 38), with the periods (*daśās*) and subperiods (*antardaśās*) of the native's life (YJ 39–41), with the cause of his death (YJ 42), and with his next incarnation (YJ 43). There follows a long section (YJ 44–51) on *aṣṭakavarga* or the transits of each of the planets (in the order Sun, Saturn, Jupiter, Venus, Mars, Mercury, and Moon) through the astrological places counted from themselves, from each other, and from the ascendant; this is a fundamental method of continuous horoscopy. Sphujidhvaja's treatment of *jātaka* ends with a description of the ideal astrologer (YJ 51, 13–20).

In large measure based on the YJ, but also dependent on the lost work of Satya,⁴ is the *Vṛddhayavanajātaka*⁵ composed by the Yavanādhirāja Mīnarāja⁶ in about 300–325 in the realm of the Western Kṣatrapas—that is, during the reign of Rudrasimha II (ca. 305–317) or Yaśodāman II (ca. 317–332). This is probably the work called *Yavana* referred to by al-Bīrūnī (India 14). It is an immense text, twice as long as the YJ, divided into seventy-one *adhyāyas*; the last eight, as we have already noted, are concerned with omens. The rest to a large extent repeat and expand upon the YJ.⁷ The remainder deal with the effect of each planet (in the order of the week-days, as henceforth is normal in Sanskrit texts) in each zodiacal sign aspected by each other planet (VYJ 9–15); on the effects of the planets in each astrological place while in various of its *vargas* (VYJ 24–35); on the ascendant aspected by each of the planets (VYJ 36); on the lord of each astrological place in its own and every other place (VYJ 54); and on the “rays” (*raśmi*) of the planets (VYJ 56). Only once—in an astrological *digvijaya* (VYJ 2, 9–10)—does Mīnarāja mention Rāhu as a *graha*; Sphujidhvaja never does. The inclusion of Rāhu and Ketu among the planets to make them nine postdates the VYJ.

⁴ The details of the dependence of Indian astrologers on the YJ and on each other will be found in my edition of Sphujidhvaja.

⁵ Edited by D. PINGREE as GOS 162–163, Baroda 1976; *adhyāyas* 1–34 with a Hindi *ṭikā* were published by RĀMASVARŪPA ŚARMAN, New Delhi 1976.

⁶ CESS A 4.

8	cf. 44–51	55	19
16	20, 25–26	57	8–9

The following authors of *jātaka* works seem to have written in the fourth or fifth century since they were quoted in the sixth by Varāhamihira: Maya,⁸ Yavana, Mañittha⁹ (Μανέθων), and Śaktipūrva (Parāśara)¹⁰ are cited on the maximum length of human life (BJ 7, 1); on the same subject of *āyurdāya* he cites Devasvāmin,¹¹ Viṣṇugupta (Cānakya¹²), and Siddhasena (BJ 7, 7); and Jivaśarman¹³ is mentioned concerning *āyurdāya* (BJ 7, 9) and *rājayogas* (BJ 11, 1). Also earlier than Varāhamihira was a *jātaka* work by Bādarāyaṇa,¹⁴ though it is not clear whether or not the extant Bhāvādhyāya¹⁵ was a part of this, and another by Māṇḍavya.¹⁶

But the Bṛhajjātaka¹⁷ itself became the model for much of the subsequent Sanskrit literature on *jātaka*, and remains the most authoritative text-book on

27. *dreṣṭkāṇa*. YJ 2–3.

The best commentary on the BJ or any other *jātaka* work is the Jagaccandrikā composed by Bhaṭṭotpala in Kāśmīra in ca. 967/969. Other commentators include Rudra, who wrote the Naukā in Kerala in 1527; Mahīdhara,¹⁸ who

GAR as ALS 79, Madras 1951; and edited with the *ṭikā* of Parameśvara by K. RAGHAVAN PILLAI as TSS 198, Trivandrum 1962. In addition to the translations mentioned above there are a Pāli version published with a Burmese translation, 3 vols., Mandalay 1908–1909; an English translation by N. C. IYER, Madras 1885, 2nd ed. Madras 1905, 3rd ed. Madras 1926; and another English translation by B. SURYANARAIN ROW, Bangalore 1919, 3rd ed. 1948.

¹⁸ CESS A 4.

composed his *vivaraṇa* at Vārāṇasī in 1599; Kṛṣṇa,¹⁹ Gadādhara Mīśra,²⁰ and two Parameśvaras (Jātakacandrikā²¹ and Horābhīprāyanirṇaya).²² Both Rudra and Mahīdhara have copied out much of the Jagaccandrikā.

Varāhamihira also wrote a summary of the BJ, the Laghujātakā,²³ in sixteen *adhyāyas*. There is the inevitable commentary, the Śiṣyahitā, written by Bhaṭṭotpala in Kāśmīra in 966; there are also commentaries composed by Maheśvara,²⁴ the father of Bhāskara, in the Sahyādri in ca. 1100; by Ananta²⁵ in 1534; and by Īśvaramīśra²⁶ (Dīpikā).

At some time after 600 was written the *pūrvakhaṇḍa* of what was to become known as the Bṛhatpārāśarahorā²⁷ ascribed to Parāśara.²⁸ It computes the *ayanāṁśa* or precession, due to a misunderstanding of Āryabhaṭa, from 522 (BPH *pūrva* 3, 31), and is deeply indebted to the BJ; it also has borrowed two verses from Sphuṇḍhivaja (BPH *pūrva* 2, 47–48 equal YJ 1, 59–60). Moreover, it was used by Kalyāṇavarman, who wrote in ca. 800 (BPH *pūrva* 2, 49–52 = S 5, 21–24; and BPH *pūrva* 21, 17–48 equal S 21, 21–52; cf. S 21, 6), and its existence is presupposed by the author of the *uttarakhaṇḍa*, which was commented on by Govindasvāmin in ca. 850. Therefore, the *pūrvakhaṇḍa* must have been written between ca. 600 and 750, and the *uttarakhaṇḍa* after the *pūrvakhaṇḍa* but before ca. 800. The *pūrvakhaṇḍa* in fifty-one *adhyāyas* is a rich but confused collection of material, much of which is unprecedented: the basic

KRISHNA RAU and V. B. CHOUDHARI, 2 vols., Bombay 1963.

²⁸ CESS A 4.

elements of astrology (2–3); aspects (4); the nature of the neonate native (5–7); the planetary operators (*kāraka*) (8–9); the astrological places (10); the mounted places (*ārūḍha*) and their next places (*upapada*) (11–12); the killer (*māraka*) planets (13); the astrological places and their lords (14–15); curses in previous incarnations (*pūrvajanmaśāpa*) (16); *aṣṭakavarga* (15–20); *nābhasa* and other *yogas* (21–22); smashing the killer planet (*mārakabheda*) (23); *āyurdāya* (24–25); death (26–27); *rājayogas* and *yogas* leading to wealth and poverty (28–31); rebirths (32); pleasure and sorrow (33); various conditions (*avasthās*) of the planets (34); the varieties of *daśās*, including *viṃśottarī*, *śoḍaśottarī*, *dvādaśottarī*, *aṣṭottarī*, *pañcōttarī*, *śatābdikā*, *caturaśītyabdikā*, *dvi-saptatikā*, *ṣaṣṭihāyanī*, and *ṣaṭtriṃśatkā* (35);²⁹ *viṃśottarīdaśās* (36); *antardaśās* and their subdivisions: *upadaśās*, *sūkṣmadaśās*, and *prāṇadaśās* (37–48); *kūlacakradaśās* (49); *caradaśās* (50); and the *sudarśanacakra* (51).

This congeries seems to consist of an original core, characterized by its being cast in the form of a dialogue between Maitreya and Parāśara, and various accretions. These latter may include: *adhyāyas* 5–6, 13–14, and 17–23, which are not dialogues and contain no vocatives; *adhyāya* 16, which is in the form of a dialogue between Pārvatī and Śaṅkara; *adhyāya* 33, which is in the form of a dialogue between Sujanma and Lomaśa; *adhyāyas* 36–48, which are spoken by Parāśara for the benefit of Maheśvara; and *adhyāyas* 49–51, which are attributed to Pārvatī. The elimination of at least *adhyāyas* 16, 33, and 49–51 would produce a more homogeneous text; but the precise extent of the *pūrvakhaṇḍa* must await a careful study of the manuscripts and of its relation to other texts—not only to the *uttarakhaṇḍa* and to Kalyāṇavarman, but also to Bhaṭṭotpalā's *ṭikā* on the BJ from which some of its verses seem to be derived.

The *uttarakhaṇḍa*, which is also a dialogue between Maitreya and Parāśara, is a much more unified composition, and its integrity is guaranteed by Govindasvāmin's commentary. It deals with *aṣṭakavarga* (1; cf. *pūrvā* 17–23), the six kinds of planetary strength (*ṣaḍbala*) (2); computing planetary strength (*iṣṭakaṣṭavarṇana*) (3); *raśmi* (4; cf. VYJ 56); the native's passage through this world (*lokayātrā*) (5–9); *āyurdāya* (10–12; cf. *pūrvā* 24–25); good fortune (*bhāgya*) (13); time units and the fruition of astrological indications (14–17); interrogations (*praśna*) (18); and, in conclusion, a table of contents (19) and a praise of the work (20). The *uttarakhaṇḍa* was commented on by Govindasvāmin in Kerala in about 850 (Prakaṭārthadīpikā), while the whole BPH was commented on by Śrīdhara and Harikṛṣṇa at Jayapura in about 1875. Despite the questionability of the authenticity of some parts of the *pūrvakhaṇḍa*, the BPH represents some notable developments in the long process by which the original Hellenistic astrology that was transmitted to India in the second century was made increasingly complex so as to generate predictions more closely approximating reality; these developments are particularly noticeable in the theories of *āyurdāya.daśās*, and the computation of planetary strength.

²⁹ See D. PINGREE, The Yavanajātaḥ of Sphujidhvaḥ, vol. 2, p. 336.

A more traditional work, but one of great importance, is the *Sārāvalī*³⁰ composed by Kalyāṇavarman,³¹ the lord of Vyāghrapadi (Vyāghrataṭi in Bengal), in about 800. Its fifty-four chapters are to a large extent based on the YJ, the VYJ, the BJ, and the BPH,³² though Kalyāṇavarman also quotes (in addition to many astrologers whom we have already mentioned) Citragupta³³ (S 54, 12), Cūḍāmaṇi³⁴ (S 5, 20 and 39, 8), Devakīrti³⁵ (S 37, 1), Brahmaśaṇḍa³⁶ (S 10, 6), who had previously been cited by Varāhamihira (BY 9, 1), and Hari (S 5, 2; 6, 1; and 6, 6). But most important for his date is his mention of Kanaka³⁷ (S 53, 1), who is probably identical with the Kanaka who served as an astrologer in the court of Hārūn al-Rashīd (786–809) in Baghdād and continued to work in Baghdād into the reign of al-Ma'mūn (813–833);³⁸ he was probably still in India till sometime in the 790's. Other Indian astrologers known to the Arabs during the 'Abbāsīd period include Āryakula,³⁹ Indra,⁴⁰ Rṣi,⁴¹ Jitāri,⁴² Jina,⁴³ Rāja, Saṅghadhāra, and Śiṅghala. The S itself was known to al-Bīrūnī (India 14).

If Kalyāṇavarman's terminus post quem is given by his use of the BPH and his reference to Kanaka, his terminus ante quem is established by the quotations from the S in Govindasvāmin's *Prakaṭārthadīpikā*, which was written in Kerala in about 850. This commentary on the *uttarakhaṇḍa* of the BPH is extraordinarily rich in quotations from early astrologers, astronomers, and mathematicians; aside from those astrologers already discussed, Govindasvāmin cites

³⁰ Edited by K. ŚRĪNIVĀSA TIRUMALĀCĀRYA, 2 (3 ?) vols., Kalpatti and Palghat 1906–1909; by V. SUBRAHMANYA ŚĀSTRĪ, Bombay 1907, 2nd ed. Bombay 1914, and 3rd ed. Bombay 1928; with a Telugu translation, Madras 1923; and edited with the Hindi *ṭīkā* of SĪTĀRĀMA JHĀ by PRAHLĀDA SVĀMIN as MM 229, Benares 1953. Adhyāya 45, the *Strijātaka*, was published with a Telugu version at Madras in 1885 and 1926. The *Sārāvalī* was translated into English by N. N. KRISHNA RAU and V. B. CHOUDHARI, [Bombay 1961]; the *Strijātaka* was translated by R. K. AIYAR, "Stri Jathakam or Female Horoscopy," *The Astrological Magazine* 5–10 (1901–1908).

Kṛṣṇa⁴⁴ (who may be identical with the author of the Kṛṣṇīya or Cintājñāna⁴⁵ which was extremely popular in Kerala), Bhagadatta,⁴⁶ Cirantana Yavana, Yavaneśvara (who is different from Sphujidhvaja, though the latter is also quoted by Govindasvāmin), and Haridatta (the seventh century astronomer, who evidently also wrote on astrology). The names of and quotations from the works of a few more authorities on *jātaka* from this early period can be found in Bhaṭṭotpala's Jagaccandrikā; they are Yama (on BJ 8, 3), Vaṅkālaka⁴⁷ (on BJ 15, 1), and Śrutakīrti (on BJ 1, 7; 8, 9; 13, 3; and 21, 3).

At some time before Śrīpati (fl. 1039–1056) wrote his Jātakakarmapaddhati⁴⁸ in Rohiṇikhaṇḍa, Śrīdhara had written on *jātaka* (see JKP 5, 36). There does exist in several manuscripts, some of which are associated with Mysore (the earliest dated example was copied in 1589), a Jātakapaddhati of Śrīdhara; and a Jaina priest named Śrīdhara from Narigunda in the Kaṇṇāṭaka wrote, in Kannāḍa, a Jātakatilaka⁴⁹ in 1049 under the Western Cālukya Someśvara I (1042–1068). What relation the two Śrīdharas might have to each other or to the astrologer cited by Śrīpati remains unclear. Śrīpati's own Jātakapaddhati or Jātakakarmapaddhati teaches in eight *adhyāyas* how to calculate the astrological places, and how to compute the amount of aspects, the strengths of the planets, the length of life, the *daśās* and *antardaśās*, and the *aṣṭakavarga*; it is closely related to the *pūrvakhaṇḍa* of the BPH. The JKP was immensely influential as is indicated by the numerous imitations of it and commentaries on it; the latter were composed by Sūryadeva at Gaṅgāpura in about 1250 (Jātakālaṅkāra); by Paramēśvara at Aśvatthagrāma in about 1425 (Bālaprabodhinī); by Acyuta in about 1525 (Bhāvārthamañjarī); by Sūryadāsa at Pārthapura in about 1550 (Bodhasudhākara); by Raghunātha (the unique manuscript was copied in 1612); by Sumatihaṛṣa Gaṇi, presumably at Khairābād, in 1616 (Subodhā); by Kṛṣṇa in about 1625; by Dullaha⁵⁰ in 1776; and by Kāmābhaṭṭa⁵¹ (Sampradāyapariśuddhi); by a Brāhmaṇa from Parakroḍa in

Kerala;⁵² by Bhāveśa;⁵³ by Bhāskara;⁵⁴ by Bhūdhara;⁵⁵ by Mādhava⁵⁶ (Janabodhinī); and by Śivadāsa.

In 1167, during the reign of the Caulukya Kumārapāla (ca. 1143–1172), at Campāvati (presumably Chātsu south of Jayapura in Rājasthān rather than Chaul south of Bombay in the Koṅkaṇa), a Jaina of the Kāśahradagaccha, Naracandropādhyāya⁵⁷ wrote a Beḍājātaka,⁵⁸ which is a *ṛtti* in verse on his own Janmasamudra. In eight *kallolas* it treats the astrology of conception, birth, congenital faults, death, *rājayogas*, other *yogas*, and *strījātaka*.

There circulates, primarily in South India, an extensive work on *jātaka* entitled Horāsāra,⁵⁹ which is sometimes attributed to Varāhamihira's son, Prthuyāsa. However, the author has borrowed verses from Kalyāṇavarman's Sārāvali⁶⁰ and so must have written after ca. 850; and the H is cited by Viṣṇuśarman⁶¹ (fl. ca. 1370), and so must have been written before ca. 1350. The H is also closely related (as is the S) to the southern Candrābharanahorā of Yavana,⁶² but unfortunately the date of that work is not yet precisely known. The H consists of thirty-two *adhyāyas* covering basically the material in the BJ with the addition of one chapter (31) on *uḍuśā*, which computes the planetary *daśās* from the *nakṣatras*, and one on omens (32). On *uḍuśā* there also exists a popular Uḍuḍāyapradīpa⁶³ based on Parāśara⁶⁴ (cf. BPH *pūrva* 35, 71–74).

⁶³ Published Calcutta [N D]; with the Hindi *ṭikā* of GOVINDARĀMA, [NP] 1859 and 1868; Bombay 1870; with a Hindi *ṭikā* Bombay 1870, Benares 1872, Delhi 1874, and Lucknow 1874; Bombay 1875; with the *ṭikā* of BHAIKAVADATTA, Calcutta 1883; edited with a Sinhalese *ṭikā* by D. FERNANDO, Colombo 1888; with a Hindi *ṭikā*, Agra 1889; with BHAIKAVADATTA's *ṭikā* in Bṛhaspati 1 (1891–97); edited with a Telugu *ṭikā*

On the same subject and called by the same title or by the title *Jātakacandrikā*⁶⁵ is a short poem by Veṅkaṭeśvara, who was the grandson of Govinda Dikṣita,⁶⁶ the court astrologer of Acyutappa Nāyaka (1560–1600) at Tanjore. Veṅkaṭeśvara has apparently borrowed several verses from the older *Uḍudāyapradīpa*.

Possibly somewhat later than the H is the *Horāmakaranda*⁶⁷ written by Guṇākara⁶⁸ at Kharjūra in Avanti. This work in thirty-one *adhyāyas* closely follows the BJ. Since Guṇākara mentions the RM composed by Bhojarāja in 1042 (HM 1, 5), and since the HM itself is often quoted by Śivarāja (ca. 1475/1500) in his *Jyotiribandha*, he must have lived between ca. 1100 and 1450.

Also quoted by Śivarāja is the *Lomaśasaṃhitā*,⁶⁹ which is basically a dialogue between Lomaśa and Sujanma, though some sections are dialogues between Śiva and Pārvatī; BPH *pūrva* 33 is a dialogue between the first pair of interlocutors. In general the Lomaśa seems to belong to the tradition of the BPH.

Vaidyanātha wrote in South India a *Jātakapārijāta*⁷⁰ in eighteen *adhyāyas* largely based on the S of Kalyāṇavarman,⁷¹ though he has also taken many

verses from the BJ⁷² and even from the H.⁷³ In general, his astrology seems more developed than that of Śrīpati; but a more exhaustive search of the relevant texts is necessary before one can establish a firm terminus post quem for the JPJ; the terminus ante, ca. 1450, is provided by the quotations in Śivarāja's Jyotiribandha. At some time after Vaidyanātha, whose work he uses,⁷⁴ Mantreśvara⁷⁵ wrote a Phaladīpikā⁷⁶ at Śrīśālivāṭī (Tinnevely). In twenty-eight *adhyāyas* he covers the main topics of *jātaka*; *adhyāya* 24 describes the *aṣṭakavarga* of Horāśāra 17.

In about 1500 at Nandigrāma in Gujarāt Keśava,⁷⁷ the father of the celebrated Gaṇeśa, composed an extremely concise (there are only forty-two verses) but very popular handbook on the principal mathematical calculations essential in *jātaka*, the Jātakapaddhati.⁷⁸ Keśava's inspiration was apparently Śrīpati's JKP, of which his JP might be regarded as a condensation. Commentaries were

⁷⁷ CESS A2, 66b–70b; A3, 24a; and A4.

⁷⁸ Published with a Marāṭhī version, Bombay 1872; with a Hindi *ṭikā*, Benares 1877; with Divākara's *ṭikā*, Benares 1882; with UMĀŚAṆKARA MIŚRA's Sanskrit and Hindi *ṭikās*, Kāśī 1890; with JAGADĪŚAPRASĀDA TRIPĀṬHIN's Hindi *ṭikā*, Bombay 1899, 2nd ed. Bombay 1924; with the Gujarātī translation and *ṭikā* of K. M. DVIVEDIN, Bombay 1909; with the *ṭikā* of GOPĪKĀNTA ŚARMAN, Ayodhyā 1924; and edited with the *ṭikās* of APŪCHA JHĀ, RĀMĀDHĪNA ŚARMAN, and himself by SĪTĀRĀMA JHĀ, Benares 1925, 2nd ed. as MM 3, Benares 1948.

composed by Keśava himself; by Viśvanātha at Kāśī in 1618; by Divākara at Kāśī in 1626 (Prauḍhamanoramā⁷⁹); by Dharmesvara⁸⁰ in the first half of the seventeenth century in Mālava (Vāsanābhāṣya); by Nārāyaṇa at Kāśī in 1678 (Jātakakaustubha); and by Gurudāsa⁸¹ at Jālandhara in 1824.

Another extremely popular work on *jātaka*, though this time a very full treatment of the subject in some forty-five *adhyāyas*, is the Jātakābharāṇa⁸² composed by Dhunḍhirāja,⁸³ the pupil and (probably) nephew of Jñānarāja, at Pārthapura in about 1525. Another sixteenth century astrologer was Nārāyaṇa Bhaṭṭa.⁸⁴ He wrote another extremely popular work, the Camatkāracintāmaṇi,⁸⁵ which, in 115 verses, gives predictions based on the presence in each of the twelve astrological places of each of the nine planets. The earliest dated manuscript was copied in 1596. There is a commentary, Anvayārthadīpikā, composed by Dharmesvara in the first half of the seventeenth century. A similar work, also entitled Camatkāracintāmaṇi, was written by Rājarsi at Dadhīyapura in Gujarāt in about 1630.

The year before Divākara wrote his Prauḍhamanoramā on Keśava's Jātakapaddhati—that is, in 1625—he composed a similar, but lengthier, treatise entitled Jātakamārgapadma,⁸⁶ in which he claims to present the essence of the *tantras* of Śrīpati, Keśava, and Sundara. Divākara wrote his own commentary on this, the Gaṇitatattvacintāmaṇi, in 1627.

⁸⁶ I have used Smith Indic 104 at Columbia University.

In the early seventeenth century a popular treatise on selected topics of *jātaka* was penned by Gaṇeśa,⁸⁷ who wrote his *Jātakālankāra*⁸⁸ at Bradhnapura on the Tāpi in Gujarāt in 1613; he states that he is following the Śukajātaka. There are commentaries written by Haribhānu Śukla in 1809; and by Kṛpārāma⁸⁹ and Narmadāgiri Avadhūta.⁹⁰

In 1629 one Harajī or Harijit wrote a *Yoginīdaśāphalaprakaraṇa* describing the eight *yoginīdaśās* in accordance with the Śivayāmala. And in 1633 Rājarsi, the son of Kalyāṇa, wrote a *Daśācintāmaṇi* at Dadhīcyapura in Gujarāt; he also was the author of a *Yoginīdaśāphala*. To a Kalyāṇa,⁹¹ who may be Rājarsi's father, is attributed a vast *Janmapatrikāpaddhati*, which is sometimes also entitled *Mānasāgari*; and to *Mānasāgara*⁹² is ascribed an identical—or at least very similar—*Mānasāgari*,⁹³ in which is incorporated Harajī's *Yoginīdaśāphalaprakaraṇa* (end of *adhyāya* 5). The earliest dated manuscript of the *Mānasāgara* version was copied in 1708. Manuscripts of Kalyāṇa's version seem to have quotations from the VYJ, the BJ, the LJ, and other works. The relations of the various *Mānasāgaris* and the various *Yoginīdaśās* to each other remain to be investigated.

In about 1625 Nṛsiṃha⁹⁴ put together a vast *nibandha* entitled *Jātakasāra-*

dīpa.⁹⁵ The earliest dated manuscript was copied in 1637, and the latest work to which the author refers is the Saurabhāṣya composed by Nṛsiṃha at Vārāṇasī in 1611; whether or not the two Nṛsiṃha's are identical cannot as yet be established. Other authorities utilized in the JSD include the YJ, the VYJ, the BJ, the LJ, the S, the HM, and, from a later period, Dāmodara, the Gaurijātaka, the Sūryārūṇasaṃvāda, and works on *tājika* and *hillāja*. In 1654 Balabhadra⁹⁶ wrote another gigantic *nibandha*, the Horāratna,⁹⁷ at the court of Shāh Shujā'. Though so late, this is an extremely full and valuable compilation deserving of a critical edition and careful study for its contributions to the histories of the texts from which it has borrowed.

A far more original work is the Sarvārthacintāmaṇi,⁹⁸ composed by Veṅkaṭeśa near Tirupati in Tamilnadu in about 1650. The core of its eighteen chapters deals in great detail with the possible influences of the twelve *bhāvas* on the native's life (*adhyāyas* 2—8). There is a commentary ascribed to Divānanda⁹⁹ (or Divānacandra) Miśra or to his son, Rādhākṛṣṇa; both lived at Lavapura (Lahore, Panjāb).

At Jambūsara in Gujarāt Yājñikanātha composed the Jātakacandrikā,¹⁰⁰ which deals with technical aspects of *jātaka* in six *prabodhas*. By this time Kāśīnātha¹⁰¹ had written his popular Lagnacandrikā;¹⁰² for the oldest dated manuscript was copied in 1670. If, however, this Kāśīnātha is identical with the author of the Praśnapradīpa and the Śiṅhrabodha, as seems likely, he flourished before 1550. A rather traditional treatise on *jātaka* is the Śambhu-horāprakāśa¹⁰³ composed by Puñjarāja¹⁰⁴ in about 1700 for Śambhudāsa (born 1662), the ruler of Nandidvārapura (Nander, Mahārāṣṭra?). Several decades later Putumana Somayājīn, the author of the Karaṇapaddhati, wrote the Jātakādeśamārga¹⁰⁵ in Kerala.

¹⁰⁵ Published Madras 1918; Kunnankulam 1930; with an English translation by V. SUBRAHMANYA SASTRI and M. M. BHAT, Bangalore 1942; with a Malayālam *ṭikā*

Before 1729 when the earliest dated manuscript was copied Jaimini¹⁰⁶ (or rather someone using the sage's name) composed the Upadeśasūtra,¹⁰⁷ a collection of 1031 *sūtras* (there is also a set of verse *kārikās* that summarize them) divided into four *adhyāyas*, each of which has four *pādas*. The only other *jātaka* work composed in *sūtras* seems to be the Jātakatattva¹⁰⁸ completed by Uḍumbara Mahādeva Pāṭhaka¹⁰⁹ at Ratnapura (Ratlam, Madhya Pradesh) in 1872. The earliest manuscript of the Upadeśasūtra already contains the commentary of Kṛṣṇānanda Sarasvatī,¹¹⁰ who calls himself a Drāviḍācārya; this commentary is also preserved in a manuscript dated 1721. Tentatively, then, one might surmise that the Upadeśasūtras were composed in South India in, perhaps, the seventeenth century. Other commentaries were written by Nilakaṇṭha Regmī¹¹¹ in 1754 at Bhatgaon, Nepāla (Subodhinī); by Ākumalla Nṛsiṃha¹¹² in South India (Arthaprakāśikā); by Nṛsiṃha Khedakara,¹¹³ probably in Mysore; by Parameśvara Yogīndra,¹¹⁴ apparently in Tamilnadu (Jyotiṣānanda); by Premanidhi¹¹⁵ (Kāśikā); by Malayavarman,¹¹⁶ the ruler of Tākumaparvata (Kāśikā); by Lakṣmaṇa in South India (Jyotiḥpradīpikā); and by Veṅkaṭeśa in South India (Bhāvakaumudī).

It would not be possible to close this discussion of the literature on *jātaka* without reference to one of the most notorious texts of this genre, which has had numerous offshoots. This is the vast collection of thousands of potential

horoscopes assembled under the name Bhṛgusaṃhitā, and presented in the form of a dialogue between Bhṛgu¹¹⁷ and Śukra. The work contains thirteen gigantic *adhyāyas*: one for each zodiacal sign, and a Yogasāgara.¹¹⁸ The earliest dated manuscript was copied in 1645; I doubt that the work antedates the sixteenth century. The manuscript copies all originate in North India, where some extraordinarily diligent fellow compiled it. A similar collection found in South India is the mammoth Saptarṣi nāḍi¹¹⁹ in Tamil.

Tājika

The word *tājika* is derived from the Pahlavī Tāzig, a term which the Iranians applied to the Arabs; it in turn is derived from the name of the Arab tribe, Ṭayyi'. Since the early eighth century, the Arabs and Persians who encroached on the Western coast of India were called Tājikas.¹²⁰ As the name for a branch of genethliology the term *tājika* refers to Indian adaptations of Arabic/Persian astrology, which was itself a combination of elements from Greek, Syriac, Sasanian, and Indian science.¹²¹ In *tājika* texts not only are a number of astrological techniques and concepts foreign to *jātaka* found—including some like the ἀφέτης or *haylāj* (Sanskrit *hillāja*) that had been a part of the YJ but later forgotten in India—but also many technical terms—e.g., *kaḇūla* (*qabūl*), *antiḥā* (*intihā'*), *hadda* (*ḥadd*), *sahama* (*sahm*), and many others.

The earliest author on *tājika* in Sanskrit was Samarasimha of the Prāgvāṭa-kula, who wrote his Gaṇakabhūṣaṇa or Tājikatantrasāra or Karmaṇprakāśikā¹²² in Gujarāt in 1274; his great-great-grandfather, Caṇḍasimha, had been a *saciva* of the Caulukya Mūlarāja II (ca. 1177–1179). Samarasimha names as his source the work of Khindika,¹²³ a name derived from the Arabic al-Hindī. There is a commentary, the Daivajñāsantoṣiṇī or Karmaṇprakāśikāvṛtti, composed by Nārāyaṇa Sāmudrika¹²⁴ in about 1725.

A relatively short text on *tājika* in seventy-three verses is the Varṣaphala¹²⁵ attributed to Maṇittha,¹²⁶ whose name, which is that of the ancient Greek authority on *jātaka* (Μανιθθα), was inspired by the Arabic technical term *muntahan*, which occurs in Sanskrit as *munthahā*. The earliest dated manuscript was copied in 1475. To a large extent based on the Varṣaphala is the Tājikamaṇi¹²⁷ completed in eighty-five verses by Mahīdhara at Vārāṇasī in 1585. Both these works are on the topic of anniversary horoscopes (*hāyana* or *varṣaphala*), which became a very prominent feature of *tājika*.

In about 1500 the well known Keśava of Nandigrāma wrote a Tājikapad-dhati¹²⁸ on *hāyana* in twenty-six verses. Commentaries were written by Viśvanātha at Golagrāma in 1610 and by Mallāri¹²⁹ in 1612. A far fuller treatment of the subject is to be found in the Tājikasāra composed by Hari in 1523. A commentary on this was written by Sumatiharṣa Gaṇi at Khairābād in 1620. That Sūryadāsa who commented on Bhāskara's L and BG at Pārthapura in 1541 and 1538 respectively was also the author of a Tājikālankāra. Perhaps in 1544 Govardhana¹³⁰ wrote a Tājikapadmakośa¹³¹ on *hāyana*. Before 1559, the date at which the earliest manuscript was copied, Vāmana authored a Tājikasāroddhāra; while in about 1575 Nṛsiṃha, who was born at Nandigrāma in 1548, wrote a Varṣaphaladīpikā on *hāyana* and a Hillājadīpikā on the *haylāj*.

But the most noteworthy and popular book on *tājika* is the Tājikanilakaṇṭhī¹³² composed by Nilakaṇṭha¹³³ at Kāśī in 1587. This is divided into two sections, which are often presented separately; the *saṃjñātāntara* on general *tājika*, and the *varṣātāntara* on *hāyana*. There exist commentaries composed by

¹³³ CESS A 3, 177 b—189 a, and A 4.

Nilakaṇṭha's son Govinda,¹³⁴ who was born in 1569, at Kāśī in 1622 (Rasālā); by Viśvanātha at Kāśī in 1629; by Mādhava,¹³⁵ who was born in 1598 as the son of Nilakaṇṭha's son Govinda, at Kāśī in 1633 (Śīsubodhinī); and by Harṣadhara (Śrīphalavardhinī).

Towards the end of the sixteenth century the high-ranking Mughul official 'Abd al-Raḥīm, who was born at Lahore in 1556 (his horoscope is given in Kṛṣṇa's *ṭikā* on Śrīpati's JKP) as the son of Bairam Khān and who was given the title Khān-i Khānān (he is known as Nabbāba Khānakhānā¹³⁶ in Sanskrit), wrote a Khetakautuka¹³⁷ on *tājika* in 124 verses. At about the same time Gaṇeśa,¹³⁸ the son of Dhunḍhirāja who wrote the Jātakābharāṇa at Pārthapura in about 1525, composed a lengthy Tājikabhūṣaṇa¹³⁹ in fourteen *adhyāyas*; and Śaṅkara wrote a Tājikacandrikā or Samāphala at Nādur, in which he mentions the sixty-year cycle from 1567 to 1627 and of which the oldest dated manuscript was copied in 1607.

In the early seventeenth century Yādava Sūri, who belonged to a family dwelling at Prakāśa in Gujarāt, penned a Tājikayogasudhānidhi in sixteen *adhyāyas*; its date is apparently 1616. Soon afterwards his son, Bālakṛṣṇa,¹⁴⁰ composed a popular Tājikakaustubha in twelve *adhyāyas*, perhaps at Jambū-saras. Bālakṛṣṇa's contemporary was the Divākara whom we have mentioned several times before; he wrote a Varṣagaṇitabhūṣaṇa or Rathoddhatā and a commentary on it entitled Mañjubhāṣiṇī.

However, the *tājika* text best known to the scholarly world because of the studies of Weber¹⁴¹ is the immensely valuable *nibandha*, the Hāyanaratna,¹⁴² composed by Balabhadra for Shāh Shujā' at Rājamahala in 1629. Like the same author's Horāratna, it is a vast collection of excerpts from earlier writers' works. As well as most of the authorities that we have already mentioned Balabhadra cites from Tejaḥsiṃha and Padmanābha. The former is probably the Tejaḥsiṃha¹⁴³ who composed a Daivajñālaṅkṛti in Gujarāt in 1336, the latter the Padmanābha¹⁴⁴ who is the author of an Hillājāyurdāya, of which the oldest dated manuscript was copied in 1699.

Tājika continued to be discussed and described in the following centuries. Briefly, the literature includes: the *Tājikaratna* composed by Gaṅgādhara at Kāśī in 1653; the *Tājikasāra* written by Venkaṭeśa in 1654; the *Tājikamañjari* composed by Jayadeva¹⁴⁵ at Śrīpura in 1671; the *Tājikakalpalatā* of Jayarāma,¹⁴⁶ of which the earliest dated manuscript was copied in 1711; the *Tājikaratna* written by Cirañjīva¹⁴⁷ of Navadvīpa, Bengal, probably in about 1725; the *Tājikasārasudhānidhi* composed by Nārāyaṇa Sāmudrika, the commentator on Samarasimha, in about 1725; and the *Tājikālankāra* written by Śambhūrāma at Dhavalapura in 1730.

CHAPTER VI

CATARCHIC ASTROLOGY

To regard the time when the Moon conjoins with a particular *nakṣatra* as propitious or unpropitious for performing certain acts was an ancient custom in India.¹ We have, indeed, encountered systematic expositions of such systems already in the Śārdūlakarṇāvadāna (pp. 81–99). In the YJ (77–78) actions to be taken on the planetary week-days, when the Moon is in each of the zodiacal signs, in the years ruled by each of the planets, and various other *yogas* are described. The Gargasamhitā (*aṅga* 1) prescribes actions to be undertaken when the Moon is in each *nakṣatra* and in each *tithi* and *karaṇa*; see also the BS (97–99) and the Śārdūlakarṇāvadāna (pp. 201–203).

Eventually a separate science developed that used this notion of auspicious and inauspicious time-units, in combination with omens and astrological *yogas*, to establish the correct time for initiating various kinds of actions; this is the science of *muhūrta*, corresponding to Hellenistic catarchic astrology. In Indian treatises on catarchic astrology great importance is given to deciding the time for performing the *samśkāras* and other ritual acts; this aspect of *muhūrta* strongly influenced *dharmaśāstra*, many treatises of which are entirely or partially devoted to this kind of prediction.² Also, a number of texts that will be discussed in this chapter represent conflations of *muhūrta* with omens, but with the *muhūrtas* as the more important component rather than the omens as in the GS and BS.

The earliest work that we know to have been devoted to *muhūrta* was the Ratnakośa composed by Lalla in, probably, the eighth century. Though a few fragmentary manuscripts of this work survive, and there are numerous quotations from it in later commentaries and *nibandhas*, its contents are not yet clear. However, Śrīpati, who wrote his Jyotiṣaratnamālā³ at Rohiṇikhaṇḍa in about 1050, claims to base a large part of it on the Ratnakośa. The contents of Śrīpati's work are: *samvatsara* (1) or the sixty-year cycle of Jupiter; the characteristics of *tithis* (2), week-days (3), *yogas* (4), *karaṇas* (5), *nakṣatras* (6), and *muhūrtas* (7); the *upagrahas* (8); the Sun's entry into the zodiacal signs

¹ See, for instance, the not always reliable account by P. V. KANE, History of Dharmaśāstra, vol. 5, part 1, Poona 1958, pp. 523–536.

² The *dharmaśāstra* texts on *muhūrta* will not be discussed here; information concerning them will be found in the appropriate entries in CESS.

³ Published with Mahādeva's *ṭīkā*, Benares 1884, 2nd ed. Calcutta 1915; *adhyāyas* 1–6 were published by P. POUCHA, "La Jyotiṣaratnamālā ou Guirlande des Joyaux d'Astrologie de Śrīpatibhaṭṭa," Arch. Or. 16 (1949), 277–309.

(*saṅkrānti*; 9); planetary transits (*gocara*; 10; cf. BS 103); the influence of the Moon (11) and of the ascendant (12); the *saṃskāras* (13); laying the sacred fire (14); the consecration of the king (15); military expeditions (*yātrā*; 16); marriage (*vivāha*; 17); building (*vāstu*; 18); entering the house (19); wearing clothes (20); and installing images of the gods (21). This became the standard arrangement for a pure *muhūrta* text; as usual, while the details of the interpretations of phenomena may vary, and while the methods employed tend to become increasingly elaborate, the basic structure of *muhūrta*, like those of the other sciences we have investigated in this volume, tended to remain unchanged. Śrīpati wrote his own Marāṭhī commentary on the JRM.⁴ Of the Sanskrit commentaries the grandest is the *vivṛti* completed by Mahādeva, Āmarāja's nephew, in Gujarāt in 1264; it is especially valuable for its numerous citations of *jyotiṣa*, *dharma*, *purāṇa*, and other types of texts. Other commentaries were composed by Dāmodara⁵ (Bālāvabodha); Paramakāruṇika⁶ (Bālābodhinī in Gujarātī or Rājasthānī; the earliest dated manuscript was copied in 1636); and Vaijā Paṇḍita (the earliest dated manuscript was copied in 1493).

Contemporaneously with Śrīpati, Bhojarāja, the famous Paramāra ruler of Dhārā, wrote (or had written) the *Rājamārtanḍa*.⁷ This text, naturally uninfluenced by the arrangement of Śrīpati's, deals, among other topics, with the names and qualities of the planets, *nakṣatras*, and zodiacal signs; with many *saṃskāras* in the order of their normal occurrences in life from conception till death; with military astrology; with building, installing images, digging wells, agriculture, planting trees, archery, mounting elephants, and a variety of other topics. Unfortunately, the printed edition includes material that does not belong to the original; for instance, it cites (p. 116) the opinion of the Kālamādhaviya, which was written by Mādhava in the late fourteenth century. A critical edition is a necessity before this fascinating collection of material on ordinary life in medieval India can be properly exploited.

In about 1100 Maheśvara,⁸ the father of the great Bhāskara, wrote a brief but relatively popular *Vṛttaśataka*⁹ on *muhūrta*.

Two of the Jaina scholars in the circle of Vastupāla, the minister of the Vāghelas Lavanaprasāda and Viradhavala in Gujarāt from 1220 till 1240, wrote popular works on *muhūrta*. Udayaprabha Sūri¹⁰ composed an *Ārambhasiddhi* or *Pañcavimarśa*¹¹ in 412 verses, on which Hemahansa wrote a *vārttika* at Āśāpallī (Ahmadābād, Gujarāt ?) in 1457 (Sudhīśṛṅgāra). And Naracandra

Sūri¹² was the author of a Jyotiṣasāra or Nāracandra¹³ in 4 *prakaraṇas*, on which a *ṭippanaka* was composed by Sāgaracandra Sūri before 1468, when the earliest dated manuscript was copied. Neither author, of course, deals with the proper moments for performing *samśkāras*.

Perhaps at about the same time (some scholars claim that the date is about 1242, though the earliest dated manuscript was not copied till 1658), someone who claims to be Kālidāsa¹⁴ and to have written at the court of Vikramāditya in 34 B.C. composed a Jyotirvidābharaṇa¹⁵ on *muhūrta* with some omen material interspersed. Bhāvaratna¹⁶ wrote his commentary, the Sukhabodhikā, at Pattana in 1711.

At Ālattūr in Kerala in the late thirteenth century Govindabhaṭṭa, one of the commentators on Varāhamihira's BJ, wrote a Muhūrtamaṇi, whose contents need to be investigated. A *vyākhyā* on this was composed by a fellow resident of Ālattūr (Aśvatthagrāma), the prolific Parameśvara, whose grandfather had been Govindabhaṭṭa's student, in the early fifteenth century.

At sometime before about 1365 someone wrote a Nāradasaṃhitā¹⁷ ascribed to the sage Nārada;¹⁸ for it is extensively quoted by Viṣṇuśarma in his Muhūrtadīpikā.¹⁹ The NS, as do several other *muhūrta saṃhitās* (cf. GS 4–11) ascribed to *ṛṣis*, begins with planetary omens (2; *grahacāra*) similar to those in conventional omen *saṃhitās*; and appends to the usual *muhūrta* material (*adhyāyas* 3–31) other omen chapters: e.g., *sadyovṛṣṭi* (32; cf. BS 28), *kūrmavibhāga* (33; cf. GS 23), *utpāta* (34; cf. GS 39), and various topics (35; cf. GS 55–58; BS 31, 35–37). Viṣṇuśarma also knew a Vasiṣṭhasaṃhitā; this, however, is different from the Vasiṣṭhasaṃhitā²⁰ that is current now. This latter text, however, is at least as old as the fifteenth century; the earliest dated manuscript was copied in 1443, and the earliest quotations are by Śivarāja in his JN.²¹ The contents of the VSA are very similar to those of the NS, save that much of the omen material in NS 32–37 is omitted. Another mixed text of this nature is the second GS already referred to in the chapter on omen literature.

²¹ E.g., VSA 37, 39 in JN, p. 191; VSA 37, 94–95 and 97 in JN, p. 196; VSA 37, 98–105 and 107–111 in JN, pp. 197–198; and VSA 37, 149 in JN, p. 199.

The most important authority on *muhūrta* in the fourteenth century, however, was Vidyāmādhava, who wrote his *Muhūrtadarśana* or *Vidyāmādhaviya*²² in the Vijayanagara Empire in about 1360. Its fifteen *adhyāyas* are concerned with terminology and definitions (1; *saṃjñā*); faults (2; *doṣa*), exceptions (3; *apavāda*), and good qualities (4; *guṇa*) of *muhūrtas*; strengths and weaknesses (5; *balābala*); the *saṃskāras* (6–9); agriculture (10; *kṛṣibhāvāpa*); installation of images of the gods (11; *devapratiṣṭhā*); military expeditions (12; *yātrā*); various other activities (13); on the *nakṣatras* (14); and on *gocara* (15). There is an extremely valuable *ṭikā* on the VM, the *Muhūrtadīpikā*, written by Vidyāmādhava's son, Viṣṇuśarman, in about 1365; as has been noted several times above, this provides a rich store of citations from the antecedent literature on several branches of *jyotiḥśāstra*.

The other important source for quotations from earlier texts is the JN of Śivarāja. He does not, however, refer to the extraordinarily popular Bālabodha or Jyotiṣasārasaṅgraha of Muñjāditya.²³ But since the earliest dated manuscript of this latter work was copied in 1479, Muñjāditya must have flourished in about 1450 or perhaps a bit before. It is probably the elementary nature of the Bālabodha to which its popularity was due. A brief but also popular *muhūrta* poem is the *Brahmavyavahāra* or *Trivikramaśataka*²⁴ composed by Trivikrama²⁵ before 1484, when the earliest dated manuscript was copied. That manuscript also contains the commentary, *Budhavallabha*, of Gopīnātha.²⁶

As in many other fields, so in *muhūrta* Keśava of Nandigrāma wrote an important work, the *Muhūrtatattva*.²⁷ His son, Gaṇeśa, dutifully wrote a *ṭikā*, the *Muhūrtadīpikā*, at Nandigrāma before 1554. Another *ṭikā* was written by Viśvanātha in the early seventeenth century; the oldest dated manuscript was copied in 1637. Probably also in the early sixteenth century Kāśinātha²⁸ composed his very successful *Śighrabodha*,²⁹ of which the earliest dated manu-

script was copied in 1559. Probably also to be dated in the early sixteenth century is the brief Bālavivekinī or Pañcaviṃśatikā³⁰ of Nāhnidatta;³¹ the earliest dated manuscript of it was copied in 1589.

A far more impressive treatise is the Muhūrtamārtanḍa³² composed by Nārāyaṇa³³ at Ṭāpara north of Devagiri in 1571. A year later he wrote a

commentary, the *Mārtaṇḍavallabha*. A *Laghumahūrtamārtaṇḍa* was apparently composed by Nārāyaṇa himself; an abridgment of the *Muhūrtamārtaṇḍa* was made by Nīlakaṇṭha³⁴ in 1680.

But within thirty years the pre-eminence of Nārāyaṇa's great treatise was eclipsed by Rāma, who completed the *Muhūrtacintāmaṇi*³⁵ with its *ṭīkā*, the *Pramitākṣarā*, at Kāśī in 1600. Another commentary, the *Piyūṣadhārā*, was composed by Rāma's nephew, Govinda, at Kāśī in 1603. For the sake of comparison the titles of the *adhyāyas* in the works of Nārāyaṇa, Rāma, and Gaṇapati are presented in Table 6; this shows clearly Nārāyaṇa's new approach to the subject, Rāma's dependence on him, and Gaṇapati's return (anticipated by Viṭṭhala) to the old tradition of Śrīpati.

But before Gaṇapati wrote toward the end of the seventeenth century, a large number of lesser authors tried their hand. These include: Bhānu,³⁶ who wrote a *Sajjanavallabha*³⁷ at Māndhātṛ in Gujarāt (the earliest dated manuscript was copied in 1602); Nāgeśa, the author of the *Grahaṇprabodha* in 1619, who also composed a *Muhūrtadīpaka*; Viṭṭhala, the author of a *Paddhatikalpavallī* in 1626, who wrote a *Muhūrtakalpadruma*³⁸ at Kāśī in 1627; Raghuvīra, Viṭṭhala's son, who composed a *Muhūrtasarvasva* in 1635; Mahādeva,³⁹ the author of a brief *Muhūrtadīpaka*⁴⁰ at Añjāra in Kaccha in 1640 and of a *vyākhyā* on the same at Bhuja in 1661; Nandikeśvara,⁴¹ who composed the *Gaṇakamaṇḍana* at Śrīsthala in Gujarāt in about 1640; Paramahansa Parivrajakācārya,⁴² who wrote a *Muhūrtamuktāvalī*,⁴³ of which the earliest dated manuscript was copied in 1645; Śrīkaṇṭha, who wrote another *Muhūrtamuktā-*

valī, whose earliest dated manuscript was copied in 1656, for Vāḍavāna at Nāḍāpagrāma; Raghunātha Kaṇṭhirava, who composed the Muhūrtamālā at Kāśī in 1660; and Yadunandana, the author of a Muhūrtamañjarī in 1669. Clearly, the interest in *muhūrta* during the seventeenth century was concentrated in Benares and Gujarāt. This did not change when Gaṇapati Rāvala⁴⁴ completed his gigantic Muhūrtagaṇapati⁴⁵ at Kāśī in 1686.

In the eighteenth century the only notable treatises on *muhūrta* were the Ratnadyota⁴⁶ composed by Gaṅgārāma Dviveda⁴⁷ in 1718 and the Jyotiṣcan-drārka⁴⁸ composed by Rudradeva Śarman at Kāśī in 1726. But the last such work to which reference should be made here is the Vyavahāraratna⁴⁹ written by Bhānunātha⁵⁰ in Mithilā in 1872. This tradition, like that of genethliology, is still very much alive.

Yātrā

Military "astrology," an aspect of catarchic astrology in which the Indian developments influenced the Syriac scholar, Theophilus of Edessa,⁵¹ in the eighth century and through him the later astrology of Islam, Byzantium, and Western Europe, began in India with the omens during the late first millennium B.C. It is found, then, in such texts as the GS (32–34) and in numerous other collections of omens, including the Narapatijayacaryā and other texts on *svara*, and regularly in treatises on *muhūrta*. *Yātrā*, which combines omens with real astrology, is also the subject of a section of the YJ (73–76); in the commentary thereon (vol. 2, pp. 389–393) a partial list of authorities on the subject, numbering fifty-six, was given. But here only the independent literature on the subject will be briefly considered.

The earliest separate treatises on *yātrā* that we have are the three composed by Varāhamihira in the sixth century: the Ṭikanikayātrā,⁵² the Yogayātrā,⁵³

and the Bṛhadyātrā.⁵⁴ Verses from each of these works occur in the other two. In addition to the omens and astrology proper, the BY (18), following the lead of Sphujidhvaja (YJ 76, 66 and 77, 1), gives detailed instructions for the worship of the planets (*grahayajña*). Commentaries on the YY and the BY were composed by Bhaṭṭotpala in Kāśmīra in about 970, and on the BY by Sūryadeva at Gaṅgāpura in the early thirteenth century; of the two commentaries on the BY all that now survives seems to be a miserable fragment of Bhaṭṭotpala's. Varāhamihira refers to Bādarāyaṇa⁵⁵ as one of his authorities, and Bhaṭṭotpala in his *tīkā* on the YY cites many verses from a Bādarāyaṇīyayātrā, of which a few manuscript copies are known.⁵⁶

After the tenth century, new literature on military astrology (aside from *adhyāyas* in *muhūrta* texts) seems to have followed the models of the Nara-patijayacaryā and the Samarasāra rather than Varāhamihira; such seems to be the case, for example, with the Yuddhajayotsava of Gaṅgārāma,⁵⁷ and it is also to a large extent true of Kumāra Gaṇaka,⁵⁸ who wrote his Raṇadīpikā⁵⁹ in Kerala. As yet little is known of the Rājaviyaya of Raṇahastin save that it was composed for a king named Mandana, the son of Hammīra, the son of Siṃhanadeva, and that the oldest dated manuscript was copied in 1600. Clearly Mandana is the Haihaya (Kalacuri) ruler of Ratnapura, Madanabrahman, the son of Ḍaṃghīra (?), the son of Siṅghaṇa, who is mentioned in the first Kosgain (Kosaṅga) Stone Inscription of his (Madanabrahman's) great-grandson Vāharendra,⁶⁰ who ruled from about 1480 till about 1515. Raṇahastin, therefore, flourished at Ratanpur north of Bilāspur in Madhya Pradeśa in about 1400.

Vivāha

Varāhamihira incorporated into his BS (102) a chapter on the astrology of marriage entitled *vivāhapaṭala*, the "marriage chest;" this was attributed to Vindhyavāsin by his commentator, Bhaṭṭotpala. But he also wrote a separate and more extensive treatise on the astrology of marriage, also entitled *Vivāhapaṭala*.⁶¹ A commentary on this was written by the faithful Bhaṭṭotpala at

(1878), 167—184, reprinted in his *Verspreide Geschriften*, vol. 1, 's-Gravenhage 1913, pp. 97—168; complete edition by JAGDISH LAL, Lahore 1944.

Kāśmīra in about 970. Thereafter, when *muhūrta* treatises became popular, they all included a section on *vivāha*—sometimes little else; and, of course, most works on *jātaka* also included discussions of this topic. Thus, Viṣṇuśarman, in commenting on VM 8 in about 1365, quotes not only from Varāhamihira, but also from Atri, Kalyāṇavarman, Gārgya, Guru, Narapati, Nārada, Bṛhaspati, Bharadvāja, Bhāgila, Bhṛgu, Yavaneśvara (not Sphujidhvaja or Mīnarāja), Lalla, Vasistha, Vāmadeva, Vāmana, Śaunaka, Śrīpati, and the Saptarṣis.

He quotes as well from a number of works whose titles but not authors he names. Among these is the *Vivāhavṇḍāvana*,⁶² which is indeed the work of that title⁶³ composed by Keśavārka.⁶⁴ In seventeen *adhyāyas* it deals in unparalleled completeness with all aspects of the subject. A commentary, the *Vivāhadīpikā* or *Karapīḍanadīpikā*, was composed by Gaṇeśa at Nandigrāma in 1554. Also ascribed to a Keśavārka⁶⁵ is a *Mauñjīpaṭala*⁶⁶ in but twelve verses.

The other *vivāha* texts that we have include the *Sārasamuccaya* or *Vivāhapāṭala*⁶⁷ of Sāraṅgapāṇi, a *nibandha* based largely on the *Sārasamuccaya* of Vaidyanātha (the earliest dated manuscript was copied in 1597); the *Vivāhapāṭala*⁶⁸ of Brahmāditya⁶⁹ (the earliest dated manuscript was copied in 1605); and the *Vivāhapāṭala*⁷⁰ composed by Pītāmbara⁷¹ at Stambhatīrtha (Cambay, Gujārāt) (the earliest dated manuscript was copied in 1615).

⁶² *Vivāhavṇḍāvana* 3, 3—4 are quoted on VM 8, 18, and *Vivāhavṇḍāvana* 3, 10 on VM 8, 20.

CHAPTER VII

INTERROGATIONS

In catarchic astrology the *jyotiṣī* determines for his client the moment (*muhūrta*) at which it is most propitious for him to undertake a specific act; in interrogations (*praśna*) he responds to a query about some aspect of the client's life on the basis of the horoscope of the moment of the query. Obviously, there is considerable overlapping of topics and methods between these two branches of astrology. *Praśna* is also related to omens since the latter are of two kinds: spontaneous and induced. The second variety, in which the diviner requests that the gods send him an omen, has clear similarities to *praśna*. Even the ceremonies of ritual purification and supplication used for induced omens (see, e.g., BS 24 and 43) are reflected in *praśna* texts (e.g., PJ 3–4). But in general the techniques of *praśna* are derived from *jātaka*.

And it is in a *jātaka* treatise, Sphujidhvaja's YJ, that *praśna* was introduced to India from the Hellenistic world. Sphujidhvaja begins (YJ 52, 1–5) with rules for reconstructing the lost horoscope of the nativity of the client from the horoscope of the time of his query; this topic, entitled *naṣṭajātaka*, was normally dealt with in later *jātaka* texts. Thereafter he discusses methods of determining the subject of the querist's question before he puts it (YJ 52, 7–10, and 53–62); in part he uses the pharmacological categories of *āyurveda* (YJ 62) associated with celestial bodies. The following *adhyāya* (YJ 63) answers the question of whether what the querist is thinking of will in fact occur; and then there come discussions of lost or stolen objects (YJ 64), of sickness and death (YJ 65), of the sex of unborn or unseen children (YJ 66), of dinner (YJ 67), of various aspects of sleep (YJ 68), and of the subjects of dreams (YJ 69–70). The final two *adhyāyas* in this section (YJ 71–72) give elaborate rules for reconstructing names from astrological phenomena.

Only parts of this treatment of *praśna* are found in the *Ṣaṭpañcāśikā*¹

composed by Varāhamihira's son, Pṛthuyāśas,² in the second half of the sixth century. He is interested in travel, warfare, profit and loss, sickness and death, marriage, and pregnancy. The most important commentaries on these fifty-six verses were composed by Bhaṭṭotpala in Kāśmīra in about 970, by Paramēśvara in Kerala in the early fifteenth century, and by Dāmodara Rāṇabha³ at Kāśī in about 1680 (Prakāśikā). Similar in content and in brevity are Bādarāyaṇa's⁴ Praśnavidyā⁵ in seventy-six verses, on which Bhaṭṭotpala wrote a commentary in about 970, and Bhaṭṭotpala's own Praśnajñāna or Āryāsaptati⁶ in seventy verses, on which commentaries were composed by Rāmakṛṣṇa at Amarāvati and by Śrīdatta.

The amount of detail in *praśna* texts, though not their scope, was enlarged in the Vidvajjanavallabha⁷ written by (or for) the Paramāra Bhojarāja of Dhārā in the first half of the eleventh century. This poem contains 180 verses divided into eighteen *adhyāyas*; nine verses are taken from Bādarāyaṇa.⁸ At about the same time, if the ascription to Śrīpati of Rohiṇikhaṇḍa is valid (the work is also, more obviously falsely, associated with Varāhamihira in 15, 43), there was composed a Daivajñavallabha⁹ in 250 verses divided into fifteen *adhyāyas*, of which the last is almost entirely derived from Varāhamihira's *yātrā* works.¹⁰

The only rival to Pṛthuyāśas' Ṣaṭpañcāśikā for popularity among *praśna* treatises is the Bhuvanadīpaka¹¹ that Padmaprabha Śūri,¹² a member of the

Nāgapuriya Tapā Gaccha of Jainas, wrote in 1164. It gives the elements of astrology (1–42); lists the queries to be judged from each astrological place (42–54), and discusses, in addition to more common topics, prices (127–137), sailing (138–144), and sex (163–164). There are several commentaries; the most notable is that written by the Jaina Simhatilaka Sūri at Vijāpura in 1269. Contemporary with Padmaprabha was another Jaina, Naracandropādhyāya of the Kāśahrada Gaccha who composed the Beḍāvṛtti on his own Janmasa-mudra in Gujarāt in 1167. A decade later, in 1177, he wrote a Praśnaśata with accompanying *avacūrṇi*; he also is the author of the succinct Jñānacatur-viṃśikā.¹³ A few years after this Caṇḍeśvara, who is probably identical with the scholar who commented on the SS in Mithilā in about 1185, produced an enormous Praśnavidyā in thirty-five or forty *adhyāyas*. Unfortunately I have as yet had access only to incomplete manuscripts of this work,¹⁴ but from these the extreme importance of this treatise for a history of *praśna* in India is evident.

Hemaprabha Sūri, the pupil of Devendra Sūri, is generally alleged to have written the Trailokyaparakāśa¹⁵ in 1248; in any case, the earliest dated manuscript was copied in 1457. This invaluable treatise is a Sanskrit version of an Arabic (or Persian) work on interrogations (it is filled with *tājika* technical terms not recognized as such by the editor) arranged in the standard fashion of Arabic astrology—a fashion going back to Theophilus of Edessa—that is, by the queries appropriate to each astrological place.

At sometime before 1569 (if that date for the copying of a manuscript of the work is correct; the next was copied in 1647) someone published a Lokamanoramā¹⁶ in twenty-two verses under the name of Garga;¹⁷ this gives a computation that determines substances in the three categories of animal, vegetable, and mineral, and some of their attributes.

In the early sixteenth century—he was a leader of the Gosvāmins (of the followers of Caitanya ?), and the earliest dated manuscript of his work was copied in 1543—Nārāyaṇadāsa Siddha¹⁸ composed the Praśnavaiṣṇava or Praśnārṇavaplava¹⁹ in which again elements of *tājika* (i.e., Arabic-Persian) interrogational astrology enter into *praśna*. Also in the early sixteenth century Kāśinātha²⁰ composed his Praśnapradīpa;²¹ the earliest dated manuscript was

copied in 1556. And perhaps from the same period is the *Praśnamāṇikyamālā* of Paramānanda Śarman;²² one manuscript is said to have been copied in 1560, but the author is also said to have flourished at the court of Balavantasimha, the Mahārāja of Kāśī in about 1748.

But we return to a secure chronology and to the renewed influence to *tājika* science with the *Praśnatāntara*²³ written by that Nilakaṇṭha who composed the *Tājikanilakaṇṭhī* in 1587. In the course of this treatise he quotes many verses from earlier works, making it a sort of *nibandha*; his favorite authorities besides the *Tājikas*, are *Prthuyāśas* and *Padmaprabha Sūri*.

In the seventeenth century *praśna* was the subject of a number of treatises, many of which cannot be securely dated. Among these are to be included the *Praśnajñāna* of Brahmārka,²⁴ of which the earliest dated manuscript was copied in 1622, and the *Jñānamañjarī* of Ṛṣiśarman,²⁵ of which the earliest dated manuscript was copied in 1646. Probably to be included in this group is the *Praśnatattva*²⁶ of Cakrapāṇi,²⁷ whose floruit lies between 1514, the year in which Vibhākara composed his *Praśnakaumudī* which Cakrapāṇi cites (10, 18), and 1800, the year in which the earliest dated manuscript of the *Praśnatattva* was copied. Other texts on *praśna* written in the seventeenth century include: the *Praśnabhairava*²⁸ composed by Gaṅgādhara, the author also of works on *jātaka*, *koṣṭhaka*, *muhūrta*, and *tājika*, at Kāśī in 1629; the *Praśnapradīpa* written by Mahādeva, the author of the *Muhūrtadīpaka*, in Kaccha in 1647; the *Praśnamārga*²⁹ composed by Nātha,³⁰ a member of the Panakkāṭṭu³¹ family of Itakkāṭ in Kerala, in 1650 (the author wrote his own *ṭikā* on this, the *Durgamārthaprakāśinī*); and the *Praśnaśiromaṇi*³² composed by that Rudramaṇi Tripāṭhin who wrote the *Ramalenduprakāśa* in 1682.

As in the cases of the other astrological sciences in India, interest in *praśna* has continued into modern times. Here it is necessary only to mention the *Praśnasāra* written by Govinda³³ at Devagiri, probably in the second quarter

CHAPTER VIII

ENCYCLOPAEDIAS AND DICTIONARIES

Some early authors on *jyotiṣa*, such as Varāhamihira, Lalla, Śrīpati, and Bhojarāja, wrote works on several of this *śāstra*'s branches. In this chapter I wish to consider those who attempted to encompass the same diversity within one work.

The earliest of such authors is a Buddhist Mahāsthavira from Śrīlaṅkā, Anavamadarśin Saṅgharāja¹ of the Hastavanagalya Mahāvihāra, who wrote his Daivajñākāmadhenu² during the reign of Parākramabāhu II (1236–1271), apparently in 1241. This deals with omens, *jātaka*, *muhūrta*, and *praśna*. Anavamadarśin's sources include Varāhamihira and Bhojarāja.

In 1315 the Jaina scholar Ṭhakkura Pherū³ composed in Prakrit at Kan-nānapura a Jyotiṣasāra⁴ on astronomy, *jātaka*, and *muhūrta*. To this is added a separate work on mathematics, the Gaṇitasāra,⁵ also in Prakrit.

The next work that ought to be placed in this category combines *jātaka* with *muhūrta*; it is Śrīnivāsa's Śuddhidīpikā.⁶ His date is a matter of great uncertainty, but he probably flourished in the fourteenth or fifteenth century. The earliest dated manuscript was copied in 1607; but a commentary, the Arthakaumudī, had been penned by Govindānanda Kavikaṅkaṇa⁷ nearly a century before. The Śuddhidīpikā was popular primarily in Bengal and Mithilā, so that this Śrīnivāsa probably lived in that area of India.

Śūramahāṭha Śivadāsa, (or Śivarāja), however, the author of the largest extant astrological *nibandha*, the Jyotiribandha,⁸ probably lived in Mahārāṣṭra or Madhya Pradeśa. Though the edited text contains various additions from

the seventeenth century⁹ (its relation to the revision by Kṛṣṇa,¹⁰ the *Samhitā-sāra*, has not been investigated), the earliest dated manuscript was copied in 1579 and the JN was cited by Pītāmbara and others earlier in the sixteenth century. Moreover, Śivādāsa (p. 25) mentions 1440 as the first year of a sixty-year cycle, which it was in the Northern Cycle. One must conclude, therefore, that he wrote in the latter half of the fifteenth century. His work is an extraordinarily rich collection of excerpts on all branches of astrology and some branches of divination from a wide range of named sources, many of which are no longer extant. A thorough investigation of Śivādāsa's manuscripts and his sources would do much to illuminate the rather obscure history of Indian astrology outside of Gujarāt in the thirteenth and fourteenth centuries.

The most extensive encyclopaedia of science conceived and executed in pre-modern India was the *Ṭoḍarānanda*¹¹ in twenty-three *saukhyas* sponsored by *Ṭoḍaramalla*,¹² an official in Akbar's government from at least 1565 till his death in 1589. He entrusted the *Jyautiṣasaukhya*, the third section, along with several sections on branches of *dharmasāstra* to Nilakaṇṭha, who later wrote the far more influential *Tājikanilakaṇṭhi* and *Praśnakaumudī*. Nilakaṇṭha completed the *Jyautiṣasaukhya* in 1572; it contains three *skandhas*—on *saṃhitā* (omens), on *ganita* (astronomy; it is not known whether or not mathematics was included), and on *horā* (genethliology). There are also two *saukhyas* by Nilakaṇṭha on *muhūrta*, one of which does not appear as part of *Ṭoḍaramalla*'s plan as reconstructed; these are the *Vivāhasaukhya* and the *Vāstusaukhya*, which latter is *saukhya* 5. Judging from the quality of Nilakaṇṭha's published works these encyclopedic opera would be well worth investigating.

On a smaller scale Kṛpāsaṅkara¹³ composed a *Jyotiṣkedāra*¹⁴ in 1627. This work has four *āvalis*: *saṃhitā* (including *muhūrta*) *ganita* (astronomy only), *horā* (*jātaka* and *tājika*), and *praśna*. There is a commentary by Cirañjīva Bhaṭṭa,¹⁵ who wrote a *Rāmaprakāśa* at Indurakhī, Gwalior, in 1647.

At about the same time Śuka composed a *Jyotiṣasāra*¹⁶ that is primarily on *muhūrta*, but includes a substantial amount of *jātaka* and *praśna* material. The earliest dated manuscript was copied in 1647. It was probably in the eighteenth century that someone claiming to be the great poet, Kālidāsa,¹⁷ wrote an

Kośa

Though various normal Sanskrit dictionaries contain definitions of terms used in astronomy and astrology (e.g., a large part of the first *khaṇḍa* of Amarasimha's *Liṅgānuśāsana*), very few specialized dictionaries of such terms were produced. It appears that the only one describing the traditional Sanskrit vocabulary is Haridatta's *Gaṇitanāmamālā*,¹⁹ of which the earliest dated manuscript was copied in 1697. Kṛṣṇadāsa,²⁰ a protégé of Akbar, wrote a *Pārasīprakāśa*²¹ in about 1575. This work consists of two parts: a Persian-Sanskrit dictionary (including terms relating to the heavens, to the directions, and to time), and a Persian grammar in Sanskrit. This, however, was entirely insufficient for translators of Persian astronomical and astrological works into Sanskrit; so, in 1643, Mārajit,²² who received the title *Vedāṅgarāya* from Shāh Jahān, wrote his *Pārasīprakāśa* at Śrīsthala in Gujarāt. In consideration of the numerous translations made from Persian and Arabic, both in the Mughal period and before, one must conclude that many other aids were available. The one that we are definitely informed of is the bilingual Muḥammad Ābidda who assisted Nayanasukhopādhyāya; and it should also be noted that many Persian technical terms used by al-Qūshjī are given their Sanskrit equivalents in the *Hayatagrantha*.

CHAPTER IX

TRANSMISSION OF JYOTIḤŚĀSTRA

At present there exist in India and outside of it some 100,000 manuscripts on the various aspects of *jyotiḥśāstra*. The great majority of these were copied within the seventeenth, eighteenth, and nineteenth centuries; for manuscripts cannot long survive in India except under exceptional circumstances. We have, therefore, essentially only those texts selected for study or composed by the scholars of the Mughal and British *rājyas*. Since the practice of copying manuscripts is virtually dead in modern India, many of these estimated 100,000 manuscripts will soon disappear, and the possibilities of our achieving a reasonably accurate assessment of the continuity, development, and transformation of the astral and mathematical sciences in India will be correspondingly diminished. But even without this appalling prospect, we must constantly be aware of the arbitrary way in which was made the selection of texts and commentaries preserved in today's libraries.

For manuscripts were preserved, with some exceptions, in India before the nineteenth century in family libraries. It is true that Anūpasimha,¹ the Mahārāja of Bikaner in Rājasthān from 1674 till 1698, formed a vast collection rich in *jyotiḥśāstra* manuscripts (many from the Deccan, where he campaigned with Aurangzib) that still survives intact in the Anup Sanskrit Library; that the core of the Sarasvatī Mahal Library in Tanjore goes back to Tulajarāja,² the Mahārāja of Tanjore from 1728 till 1736, and his predecessors; that, at the same time, Savāi Jayasimha collected some of the manuscripts now in the Jayapura Museum; and that the incredible treasures of a number of the ancient Jaina Bhāṇḍāras of Gujarāt and Rājasthān have been accumulating since the twelfth and thirteenth centuries. Still, most of our manuscripts were in small private collections till recently—or still are. And these small collections tend to preserve a few of the accepted astronomical works of the region (if the family produces *pañcāṅgas*) and the standard works on *jātaka*, *tājika*, *muhūrta*, *praśna*, and *saṃhitā* (if they are astrologers); beyond this they might contain locally popular works, or even manuscripts—sometimes unique—of treatises composed by members of their own families. Since education in the *śāstra* was through a *guru* normally rather than through a *pāṭhaśālā* or *maṭha*, the enrichment of these family libraries was probably most common when a son was sent to study with an external *guru*; one of the most notable examples of this that we have is

¹ CESS A 1, 43b—44a.

² CESS A 3, 87b—88b.

Divākara of Golagrāma, whose family we shall soon discuss. In large cultural centers like Kāśī, of course, intercourse was easier. And Jaina monks in their ordained peregrinations spread both learning and manuscripts. It was a recognized pious act for a Jaina layman to bear the expense of the copying of manuscripts for these monks; and many of them, as we know from their colophons, occupied the rainy seasons with scribal work.

It is clear, then, that chance has to a large extent determined what has survived of the truly immense body of material on *jyotiḥśāstra* that has existed in the past. As an example of this, let us examine the members of the Girinārāyaṇajñāti³ of Gujarāt, who are known primarily because much of their family library was included in the gift of manuscripts presented to the East India Company by the Gaikawar of Baroda in 1809.⁴ Many of them copied extant manuscripts (their names are followed by S), and some were authors of original works (see Table 7). Though there are several gaps at present in our knowledge of the precise relationship of several generations of this family, it is clear that they were active as scribes and authors from about 1500 till 1750; and that, if their library had not been preserved by the Gaikawar's gift, we would not know of the Gaṇitacūḍāmaṇi of Harihara or the Grahavidyādhara of Vidyādhara (there is just one other manuscript of his Pañcāṅgavidyādhari besides that in the family collection), and a number of the relatively rare works would be attested by an even smaller number of extant copies.

Another case that it is instructive to examine is that of the family which produced the great Bhāskara in the twelfth century (see Table 8⁵) and which lived in the Sahyādri range, though we possess no manuscripts from their family library. That library presumably was part of the endowment of the *maṭha* established by Soḍeva under the Yādava Siṅghaṇa at Pāṭṇā in Khandesh in 1207 for the study of the works of Bhāskara; Bhāskara's grandson, Caṅgadeva, was one of Siṅghaṇa's court astrologers, as was also Bhāskara's nephew's son, Anantadeva. It is regrettable, then, that we no longer have either of Anantadeva's works or his great grandfather, Maheśvara's, Karaṇaśekhara. However, we do have one treatise that may well have been written by a student of the *maṭha*; this is the Laghukhecarasiddhi composed by Śrīdhara in 1227, a rare work of which one of the three available manuscripts was copied by Nilakaṇṭha of the Girinārāyaṇajñāti at Jirṇadurga in 1555.

Whatever the fate of the *maṭha* and its library after the fall of Devagiri in 1312, the region was particularly fertile in producing families of *jyotiḥśāstra* who

³ SATE, pp. 186—188.

⁴ D. PINGREE, Śrīdhara's Laghukhecarasiddhi, Baroda 1976, pp. 10—16.

⁵ The earliest known member of the family, Trivikrama, is sometimes identified with the author of the Damayantīkathā, who was the son of Nemāditya, the son of Śrīdhara of the Śāṇḍilyagotra. However, this identification is unlikely since Trivikrama the son of Nemāditya composed the Navasāri grant of Rāṣṭrakūṭa Indra III in 915, while our Trivikrama's son Bhāskara was honored by Bhojarāja a century later.

were proud to preserve their lineages. One center of activity was Pārthapura on the Godāvarī, which has been identified with Pathri in the Parbhani District some eighty miles southeast of Devagiri, whose Muslim lord ruled the area for much of the medieval period. In Pārthapura flourished from about 1300⁶ the family that produced Jñānarāja, Sūryadāsa, and others (see Table 9). In keeping with the traditions of the region, several members of this family wrote works dependent on those of Bhāskara; their family library clearly contained copies of his opera. We are lucky to have a partial genealogy of the descendants of Sūryadāsa provided by one of them in 1895.⁷ Sūryadāsa's great-grandson in this lineage was a Gopāla, who lived from 1623 till 1668. He is not identical with the father of Vireśvara (see Table 10), a fellow resident of Pārthapura, since Vireśvara was old enough to comment on Bhāskara's L in 1639; but he may be a cousin (perhaps once or several times removed). Some of the manuscripts belonging to this family could be ascertained by a careful examination of their works; whether or not Vireśvara had access to the same library might be then determined by reading his commentaries and other treatises.

In a village in the district (*deśa*) of Pārthapura named Golagrāma another family of the Bhāradvājagotra began its career in the middle of the fifteenth century (see Table 11); it is linked to the family we have just discussed by the fact that one of Vireśvara's works is a commentary on one of Divākara's astrological treatises. However, its history is quite different; for in the early sixteenth century that Divākara's great-grandfather, also named Divākara, went to Nandigrāma to study with the famous Gaṇeśa (see Table 12). From Gujarāt he evidently travelled to Kāśī, where his descendants became one of the two prominent families of *jyotiḥśis* in the seventeenth century. Divākara presumably brought with him copies of his *guru's* works and those of his *guru's* father, Keśava; and we find that a considerable portion of the scholarly energy of the family was devoted to explicating the various treatises of Keśava and Gaṇeśa. However, following the local preference in Kāśī, they also expounded the Saurapakṣa; and they were receptive to some elements of Islamic astronomy.

The rival family in Kāśī (see Table 13) in the seventeenth century originated at Dadhigrāma on the Payoṣṇī to the northwest of Pārthapura; for Munīśvara places it near Gaṅgābhaiśilanagara near the Godāvarī (perhaps Gangapur in the Aurangabad District), in the district (*samadeśa*) of Elavapura (Ellora). The Payoṣṇī on whose bank Dadhigrāma lies, then, must be the Pūrṇa that eventually flows into the Godāvarī some thirty miles to the east of Pārthapura, though Dadhigrāma would have been near the headwaters, just south of Bhāskara's Sahyādri range. This family traces its history back to the middle of the fifteenth century also, and moved to Kāśī in the late sixteenth century. Its interests were divided between Bhāskara's works, the Saurapaksa, and

⁶ Gaṇeśa puts the origin of his family under Rāma the lord of Devagiri, who must be the Yādava Rāmacandra, who ruled from 1271 till 1311.

⁷ CESS A3, 75a–75b.

Gaṇeśa's works, while some of its members vehemently attacked members of the Golagrāma family for their acceptance of Islamic astronomical theories. Another family (see Table 14) that flourished in the same area came originally from an unidentified place called Sāsamañūra, but had settled in Ṭāpara to the north of Devagiri in the late sixteenth century.

One last case may be considered to illustrate the influx of *jyotiḥśāstra* from Vidarbha into Kāśī in the sixteenth century. This family (see Table 15) originated at Dharmapura on the Narmadā in the early part of that century, but became prominent—primarily as astrologers—at Kāśī toward the end of the century.

This pattern of families of *jyotiḥśāstra* equipped with their own libraries that we can trace in some instances over several centuries was not the norm in South India, though family connections there also obviously had a strong influence. The area that is best known is Kerala, where libraries were maintained at the family *illam*, but where new members of the "school" were often recruited from outside the family. The most impressive line is that of Parameśvara⁸ (see Table 16); it can be continued from Acyuta to the middle of the nineteenth century.⁹ Other, lesser lines are known from Kerala; unfortunately, our information from other Dravidian-speaking areas is not detailed enough to discern any such pattern (but see Table 17).

However, the continuation of these traditions throughout India was, of course, due not only to the transmission of learning from father to son or from *guru* to *śiṣya*; it was also actively cultivated by the patronage of the powerful—usually Mahārājas. Thus the court of Paramāra Bhojarāja at Dhārā produced a number of *jyotiḥśāstra* treatises under the Mahārāja's name in the early eleventh century, and provided encouragement to Bhāskara's great-great-great-grandfather, and probably to Daśabala as well. Mughal patronage of Sanskrit works on *jyotiḥśāstra* in the sixteenth and seventeenth century was extremely generous.¹⁰ And, of course, various of the courts of Rājasthān in the same period—and into the nineteenth century in some cases—maintained *jyotiḥśāstra*, many of whom became authors. But a more interesting development occurred in Gujarāt under the Caulukyās. A number of their leading state officials or members of their families, belonging primarily to the Prāgvātavaṃśa (see Tables 18, 19, and 20), though there are also some who belonged to the Janyālayakula (see Table 21), wrote on *jyotiḥśāstra*. The reasons for this phenomenon are not apparent. Naturally, other scholars worked in this field under the Caulukyās who were not members of ministerial families; such are the Jaina Naracandropādhyāya, who composed one of his works at Campāvātī in 1167 under Caulukya Kumārapāla, and

⁸ See K. V. SARMA, "Direct Lines of Astronomical Tradition in Kerala," Charu-deva Shastri Felicitation Volume, Delhi 1974, pp. 601–604.

Narapati, the son of Naradeva of Dhārā, who completed the Narapatijayacaryā at Aṇahilanagara in 1177 under Caulukya Ajayapāla.

But there was another relationship that we can observe in Gujarāt in this period. Jaina monks such as Naracandropādhyāya often became authors of *jyotiṣa* texts; but we usually are ignorant of the intellectual climate and economic situation under which they labored. Vastupāla, the minister of Caulukya [Vāghela] Viradhavala and Visaladeva at Dhavalakka (Dholkā, Gujarāt) from 1220 till his death in 1240 and a Jaina member of the Prāgvāṭavaṃśa, was a great patron of Jaina scholars,¹¹ among whom were numbered two *jyotiṣis*: Udayaprabha Sūri and Naracandra Sūri. The extent to which these men, or others, Jaina or Hindu, who received princely rewards for their scientific activities, were encouraged and assisted by the milieu provided by their patrons must have varied from individual to individual. But it must be recognized that this patronage of scholars by the powerful, sporadic as it was (it seems to have been more frequent and sustained over longer periods in Gujarāt and Rājasthān than elsewhere in India), served as an alternative mode for the intermingling of traditions, the production of new works, and the copying and preservation of manuscripts to the more traditional family libraries and Jaina *bhāṇḍāras*. When CESS is completed, it will be possible to analyze the surviving evidence concerning who copied manuscripts (often we observe families of scribes functioning for as many generations as the families of *jyotiṣis*) and who owned them. Until then I leave the question at this point.
